#### **AGREEMENT OF USE**

#### COPYRIGHT RESTRICTIONS

- This document is provided "as is" by the OPC Foundation and the PI.
- Right of use for this specification is restricted to this specification and does not grant rights of use for referred documents.
- Right of use for this specification will be granted without cost.
- This document may be distributed through computer systems, printed or copied as long as the content remains unchanged and the document is not modified.
- OPC Foundation and PI do not guarantee usability for any purpose and shall not be made liable for any case using the content of this document.
- The user of the document agrees to indemnify OPC Foundation and PI and their officers, directors and agents harmless from all demands, claims, actions, losses, damages (including damages from personal injuries), costs and expenses (including attorneys' fees) which are in any way related to activities associated with its use of content from this specification.
- The document shall not be used in conjunction with company advertising, shall not be sold or licensed to any party.
- The intellectual property and copyright is solely owned by the OPC Foundation and the PI.

#### **PATENTS**

The attention of adopters is directed to the possibility that compliance with or adoption of OPC or PI specifications may require use of an invention covered by patent rights. OPC Foundation or PI shall not be responsible for identifying patents for which a license may be required by any OPC or PI specification, or for conducting legal inquiries into the legal validity or scope of those patents that are brought to its attention. OPC or PI specifications are prospective and advisory only. Prospective users are responsible for protecting themselves against liability for infringement of patents.

#### WARRANTY AND LIABILITY DISCLAIMERS

WHILE THIS PUBLICATION IS BELIEVED TO BE ACCURATE, IT IS PROVIDED "AS IS" AND MAY CONTAIN ERRORS OR MISPRINTS. THE OPC FOUDATION NOR EPSG MAKES NO WARRANTY OF ANY KIND, EXPRESSED OR IMPLIED, WITH REGARD TO THIS PUBLICATION, INCLUDING BUT NOT LIMITED TO ANY WARRANTY OF TITLE OR OWNERSHIP, IMPLIED WARRANTY OF MERCHANTABILITY OR WARRANTY OF FITNESS FOR A PARTICULAR PURPOSE OR USE. IN NO EVENT SHALL THE OPC FOUNDATION NOR EPSG BE LIABLE FOR ERRORS CONTAINED HEREIN OR FOR DIRECT, INDIRECT, INCIDENTAL, SPECIAL, CONSEQUENTIAL, RELIANCE OR COVER DAMAGES, INCLUDING LOSS OF PROFITS, REVENUE, DATA OR USE, INCURRED BY ANY USER OR ANY THIRD PARTY IN CONNECTION WITH THE FURNISHING, PERFORMANCE, OR USE OF THIS MATERIAL, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

The entire risk as to the quality and performance of software developed using this specification is borne by you.

#### RESTRICTED RIGHTS LEGEND

This Specification is provided with Restricted Rights. Use, duplication or disclosure by the U.S. government is subject to restrictions as set forth in (a) this Agreement pursuant to DFARs 227.7202-3(a); (b) subparagraph (c)(1)(i) of the Rights in Technical Data and Computer Software clause at DFARs 252.227-7013; or (c) the Commercial Computer Software Restricted Rights clause at FAR 52.227-19 subdivision (c)(1) and (2), as applicable. Contractor / manufacturer are the OPC Foundation, 16101 N. 82nd Street, Suite 3B, Scottsdale, AZ, 85260-1830

#### COMPLIANCE

The combination of EPSG and OPC Foundation shall at all times be the sole entities that may authorize developers, suppliers and sellers of hardware and software to use certification marks, trademarks or other special designations to indicate compliance with these materials as specified within this document. Products developed using this specification may claim compliance or conformance with this specification if and only if the software satisfactorily meets the certification requirements set by PI or the OPC Foundation. Products that do not meet these requirements may claim only that the product was based on this specification and must not claim compliance or conformance with this specification.

#### **TRADEMARKS**

Most computer and software brand names have trademarks or registered trademarks. The individual trademarks have not been listed here.

**GENERAL PROVISIONS** 

Should any provision of this Agreement be held to be void, invalid, unenforceable or illegal by a court, the validity and enforceability of the other provisions shall not be affected thereby.

This Agreement shall be governed by and construed under the laws of Germany.

This Agreement embodies the entire understanding between the parties with respect to, and supersedes any prior understanding or agreement (oral or written) relating to, this specification.

#### 1 1 General

2

10

11

12 13

14

15

#### 1.1 OPC Foundation

- 3 OPC is the interoperability standard for the secure and reliable exchange of data and information in
- 4 the industrial automation space and in other industries. It is platform independent and ensures the
- 5 seamless flow of information among devices from multiple vendors. The OPC Foundation is
- 6 responsible for the development and maintenance of this standard.
- 7 OPC UA is a platform independent service-oriented architecture that integrates all the functionality of
- 8 the individual OPC Classic specifications into one extensible framework. This multi-layered approach
- 9 accomplishes the original design specification goals of:
  - Platform independence: from an embedded microcontroller to cloud-based infrastructure
  - Secure: encryption, authentication, authorization and auditing
  - Extensible: ability to add new features including transports without affecting existing applications
    - Comprehensive information modelling capabilities: for defining any model from simple to complex

#### 16 1.2 PROFINET Standardization Group (PNO)

- 17 The PROFIBUS and PROFINET user organization (PNO: Profibus Nutzerorganisation e. V.) was
- 18 founded in 1989 and is the largest automation community in the world and responsible for PROFIBUS
- 19 and PROFINET, the two most important enabling technologies in automation today. The PNO is
- 20 member of PROFIBUS and PROFINET International (PI).
- 21 The common interest of the PNO global network of vendors, developers, system integrators and end
- 22 users covering all industries lies in promoting, supporting and using PROFINET. Regionally and
- 23 globally about 1,400 member companies are working closely together to the best automation possible.
- No other fieldbus organization in the world has the same kind of global influence and reach.
- 25 The name of the Joint Working Group (JWG) is "Safety over OPC UA".

#### 26 1.3 Relation to safety-, security- and OPC UA-standards

- 27 This specification explains the relevant principles of functional safety for communication with reference
- 28 to the IEC 61508 series as well as IEC 61784-3 and others (see Figure 1) and specifies a safety
- 29 communication layer based on the OPC Unified Architecture.
- 30 Figure 1 shows the relationship between this specification and the relevant safety and OPC UA
- 31 standards in an industrial environment. An arrow from Document A to Document B means "Document
- 32 A is referenced in Document B".

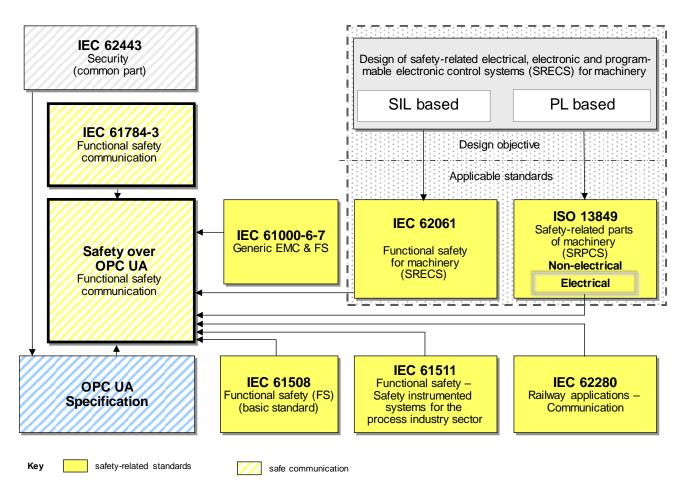

Figure 1 - Relationships of Safety over OPC UA with other standards

35 36

37

38

39

40

41

42 43

44

34

Safety over OPC UA do this in such a way that OPC UA can be used for applications requiring functional safety up to the Safety Integrity Level (SIL) 4.

The resulting SIL claim of a system depends on the way implementation of Safety over OPC UA is implemented within this system. That means that if a certain SIL is desired, this specification has to be implemented on a device which fulfils the requirements for this SIL as described in IEC 61508. In particular, measures against random hardware failures and systematic errors (e.g. software bugs) must be taken.

Table 1 – Intended for implementation of Safety over OPC UA

#### Safety over OPC UA is intended for implementation in safety devices exclusively.

Simply implementing this specification in a standard device (i.e. a device not fulfilling the requirements of IEC61508) is not sufficient to qualify it as a safety device.

A safety device with Safety over OPC UA shall fulfil the requirements of IEC 61508 (according the SIL-level as described) when used in live operation.

45

46

47

48

This specification does not cover electrical safety and intrinsic safety aspects. Electrical safety relates to hazards such as electrical shock. Intrinsic safety relates to hazards associated with potentially explosive atmospheres.

- 49 This specification defines mechanisms for the transmission of safety-relevant messages among
- 50 participants within a network using OPC UA technology in accordance with the requirements of
- 51 IEC 61508 series and IEC 61784-3 for functional safety. These mechanisms may be used in various
- 52 industrial applications such as process control, manufacturing automation and machinery.
- 53 This specification provides guidelines for both developers and assessors of compliant devices and
- 54 systems.

#### 1.4 Patent declaration

- 56 The PNO draws attention to the fact that it is claimed that compliance with this document may involve
- 57 the use of patents concerning the functional safety communication as follows, where the [xx] notation
- indicates the holder of the patent rights:

US 6907542

[SI] System, device and method for determining the reliability of data carriers in a fail-safe system network

59

55

- 60 PNO takes no position concerning the evidence, validity and scope of these patent rights.
- 61 The holders of these patents rights have assured the PNO that they are willing to negotiate licenses
- 62 either free of charge or under reasonable and non-discriminatory terms and conditions with applicants
- 63 throughout the world. In this respect, the statements of the holders of these patent rights are registered
- 64 with PNO.
- 65 Information may be obtained from:

[SI] Siemens Aktiengesellschaft

CT IP M&A Otto-Hahn-Ring 6 81739 München GERMANY

- 66 Attention is drawn to the possibility that some of the elements of this document may be the subject of
- 67 patent rights other than those identified above. PNO shall not be held responsible for identifying any
- 68 or all such patent rights.

69

70

#### 96 3 Terms, definitions and conventions

- 97 3.1 Overview
- 98 This specification will use these concepts of OPC UA information modeling to describe Safety over
- 99 OPC UA. For the purposes of this document, the terms and definitions given in OPC UA Part 1, OPC
- 100 UA Part 3, OPC UA Part 6, and IEC 61784-3 as well as the following apply.

- 102 **3.2 Terms**
- 103 **3.2.1**
- 104 Cyclic Redundancy Check
- 105 CRC
- 106 <value> redundant data derived from, and stored or transmitted together with, a block of data in order
- 107 to detect data corruption
- 108 <method> procedure used to calculate the redundant data
- 109 NOTE 1 to entry: Terms "CRC code" and "CRC signature", and labels such as CRC1, CRC2, may also be used in this
- specification to refer to the redundant data.
- 111 [SOURCE: IEC 61784-3:2017, 3.1]
- 112 **3.2.2**
- 113 error
- 114 discrepancy between a computed, observed or measured value or condition and the true, specified or
- theoretically correct value or condition
- 116 NOTE 1 to entry: Errors may be due to design mistakes within hardware/software and/or corrupted information due to
- electromagnetic interference and/or other effects.
- NOTE 2 to entry: Errors do not necessarily result in a failure or a fault.
- 119 [SOURCE: IEC 61508-4:2010, 3.6.11]
- 120 **3.2.3**
- 121 failure
- termination of the ability of a functional unit to perform a required function or operation of a functional
- 123 unit in any way other than as required
- 124 NOTE 1 to entry: Failure may be due to an error (for example, problem with hardware/software design or message
- 125 disruption).
- 126 [SOURCE: IEC 61508-4:2010, 3.6.4, modified notes and figures deleted]

- 3.2.4 127
- 128 fail-safe
- 129
- 130 ability of a system that, by adequate technical or organizational measures, prevents from hazards
- 131 either deterministically or by reducing the risk to a tolerable measure
- 132 NOTE 1 to entry: Equivalent to functional safety
- 133 3.2.5
- 134 fail-safe substitute values
- **FSV** 135
- values which are issued or delivered instead of process values when the safety function is set to a 136
- 137 fail-safe state
- 138 NOTE 1 to entry: In this specification, the fail-safe substitute values (FSV) shall always be set to binary "0".
- 139 3.2.6
- 140 fault
- 141 abnormal condition that may cause a reduction in, or loss of, the capability of a functional unit to
- 142 perform a required function
- 143 NOTE 1 to entry: IEV 191-05-01 defines "fault" as a state characterized by the inability to perform a required function,
- 144 excluding the inability during preventive maintenance or other planned actions, or due to lack of external resources.
- 145 [SOURCE: IEC 61508-4:2010, 3.6.1, modified – figure reference deleted]
- 146 3.2.7
- 147 flaq
- a non-safe bit indication to perform test information. 148
- 149 3.2.8
- 150 **Globally Unique Identifier**
- **GUID** 151
- A universally unique identifier (GUID) is a 128-bit number used to identify information in computer 152
- systems. The term globally unique identifier (GUID) is also used 153
- 154 [SOURCE: Wikipedia]
- 155 3.2.9
- 156 MonitoringNumber
- 157 **MNR**
- 158 a means used to ensure the correct order of transmitted safety PDUs and to monitor the communication
- 159 delay. The MNR starts at a random value and counts up with each request. It rolls over to a minimum
- threshold value that is not zero. 160
- 161 NOTE 1 to entry: Instance of sequence number as described in IEC 61784-3.
- 162 NOTE 2 to entry: The transmitted MNR is secured via the transmitted CRC signature of the SDataPDU
- 163 3.2.10
- **OPC UA Mapper** 164
- part of the Safety over OPC UA implementation which maps the SPDU to the actual OPC UA services. 165
- Depending on which services are used (e.g. client/server or pub/sub), different mappers can be 166
- 167 specified
- 168 3.2.11
- 169 performance level
- 170 PL
- discrete level used to specify the ability of safety-related parts of control systems to perform a safety 171
- 172 function under foreseeable conditions
- 173 [SOURCE: ISO 13849-1:2015, 3.1.23]
- 174 3.2.12
- 175 process values
- 176
- 177 input and output data (in a safety PDU) that are required to control an automated process

- 178 3.2.13
- qualifier 179
- 180 O
- 181 Qualifier is an attribute (bit or boolean), indicating whether the corresponding value is valid or not (e.g.
- 182 being a fail-safe substitute value)
- 183 3.2.14
- 184 residual error probability
- 185 RP
- 186 probability of an error undetected by the SCL safety measures
- 187 [SOURCE: IEC 61784-3:2017, 3.1]
- 188 3.2.15
- 189 residual error rate
- 190 statistical rate at which the SCL safety measures fail to detect errors
- 191 [SOURCE: IEC 61784-3:2017, 3.1]
- 192 3.2.16
- 193 safety communication layer
- 194 SCL
- 195 communication layer above the OPC UA Communication Stack (OPC UA Server API or OPC UA Client
- 196 API) that includes all necessary additional measures to ensure safe transmission of data in accordance
- 197 with the requirements of IEC 61508.
- 198 The SafetyProvider together with the SafetyConsumer represent the SCL.
- 199 [SOURCE: IEC 61784-3:2017, 3.1 modified]
- 200 3.2.17
- 201 **SafetyConsumer**
- 202 The SafetyConsumer sends a request to the SafetyProvider and checks the response (SPDU) for
- 203 timeliness, authenticity and data integrity in accordance with IEC 61784-3
- 204 3.2.18
- 205 safety data
- 206 **SData**
- 207 application data transmitted across a safety network using a safety protocol
- 208 NOTE 1 to entry: The Safety Communication Layer does not ensure the safety of the data itself, but only that the data is
- 209 transmitted safely.
- 210 3.2.19
- 211 safety function response time
- 212
- 213 worst case elapsed time following an actuation of a safety sensor connected to a fieldbus, until the
- 214 corresponding safe state of its safety actuator(s) is achieved in the presence of errors or failures in
- 215 the safety function
- 216 217 NOTE 1 to entry: This concept is introduced in IEC 61784-3:-, 5.2.4 and is addressed by the functional safety
- communication profiles defined in this specification.
- 218 [SOURCE: IEC 61784-3:2017, 3.1]
- 219 3.2.20
- 220 safety integrity level
- 221
- 222 discrete level (one out of a possible four), corresponding to a range of safety integrity values, where
- 223 safety integrity level 4 has the highest level of safety integrity and safety integrity level 1 has the lowest
- 224 level of safety integrity
- NOTE 1 to entry: The target failure measures (see IEC 61508-4:2010, 3.5.17) for the four safety integrity levels are specified
- 226 in Tables 2 and 3 of IEC 61508-1:2010.
- 227 NOTE 2 to entry: Safety integrity levels are used for specifying the safety integrity requirements of the safety functions to
- 228 be allocated to the E/E/PE safety-related systems.

- 229 NOTE 3 to entry: A safety integrity level (SIL) is not a property of a system, subsystem, element or component. The correct
- 230 231 interpretation of the phrase "SILn safety-related system" (where n is 1, 2, 3 or 4) is that the system is potentially capable of
- supporting safety functions with a safety integrity level up to n.
- 232 [SOURCE: IEC 61508-4:2010, 3.5.8]
- 233 3.2.21
- 234 safety measure
- 235 measure to control possible communication errors that is designed and implemented in compliance
- 236 with the requirements of IEC 61508
- 237 NOTE 1 to entry: In practice, several safety measures are combined to achieve the required safety integrity level.
- 238 NOTE 2 to entry: Communication errors and related safety measures are detailed in IEC 61784-3:2017, 5.3 and 5.4.
- 239 [SOURCE: IEC 61784-3:2017, 3.1]
- 240 3.2.22
- 241 safety PDU
- 242 SPDU
- 243 PDU transferred through the safety communication channel
- 244 NOTE 1 to entry: The SPDU may include more than one copy of the safety data using differing coding structures and hash
- 245 functions together with explicit parts of additional protections such as a key, a sequence count, or a time stamp mechanism.
- 246 NOTE 2 to entry: Redundant SCLs may provide two different versions of the SPDU for insertion into separate fields of the
- 247 OPC UA frame.
- [SOURCE: IEC 61784-3:2017, 3.1] 248
- 249 3.2.23
- 250 SafetyProvider
- 251 The SafetyProvider answers the request from the SafetyConsumer with the current Safety Data
- 252 together with the additional data to give the SafetyConsumer the ability to check these SPDU for
- timeliness, authenticity and data integrity in accordance with IEC 61784-3 253
- 254 3.2.24
- 255 **SDataBaseID**
- 256 Authenticity ID which is in a hierarchical view in the level above the SDataProvID. The typical use
- 257 case is one SDataBaseID at machine-level for a lot of SafetyProviders at field-level. The pair of
- 258 SDataBaseID together with the SDataProvID is used to check the authenticity of incoming data
- 259 NOTE 1 to entry: Together with the SDataProvID it is the instance of connection authentication as described in IEC 61784-3.
- 260 3.2.25
- 261 **SDataProvID**
- Within an area of same SDataBaseID the SafetyProviders shall have unique SDataProvIDs. The pair 262
- 263 of SDataProvID together with the SDataBaseID is used to check the authenticity of incoming data by
- 264 the SafetyConsumer
- 265 NOTE 1 to entry: Together with the SDataBaseID it is the instance of connection authentication as described in IEC 61784-3.
- 266 3.2.26
- 267 SPDU sample rate
- 268 Number of SPDUs checked by the receiving SCL per hour

#### 3.5 Conventions

#### 276 3.5.1 Conventions in this specification

277 In this specification, the following conventions are used:

- The abbreviation "F" is an indication for safety related items, technologies, systems, and units (fail-safe, functional safe).

- The default data that shall be used in case of unit failures or errors, are called Fail-safe substitute Values (FSV) and are set to binary "0".

285

286

287

288

289

290

294

295

- Reserved bit ("res") shall be set "0" and ignored by the receiver for avoiding problems with future versions of Safety over OPC UA.
  - Terms and names are often written in PascalCase (the practice of writing compound words or phrases in which the elements are joined without spaces, with each element's initial letter capitalized within the compound). Terms or names where two capital letters of abbreviations are in sequence or for separation to a suffix are written with underscores in between.
  - Notation 0x... represents a hexadecimal value.

#### 3.5.2 Conventions on CRC calculation

- Any CRC signature calculation is starting with a preset value of "1".
- 291 Any CRC signature calculation resulting in a "0" value, will use the value "1" instead.
- SPDU with all values (incl. CRC signature) being==0 shall be ignored by the receiver (SafetyConsumer and SafetyProvider).

#### 3.5.3 Conventions in state machines

#### Table 2 - Conventions used in state machines

Convention	Meaning	
:=	Assignment: value of an item on the left is replaced by value of the item on the right.	
<	Less than: a logical condition yielding TRUE if and only if an item on the left is less than the item on the right.	
<=	ess or equal than: a logical condition yielding TRUE if and only if an item on the left is less or equal nan the item on the right.	
>	Greater than: a logical condition yielding TRUE if and only if the item on the left is greater than the item on the right.	
>=	Greater or equal than: a logical condition yielding TRUE if and only if the item on the left is greater or equal than the item on the right.	
==	Equality: a logical condition yielding TRUE if and only if the item on the left is equal to an item on the right.	
<>	Inequality: a logical condition yielding TRUE if and only if the item on the left is not equal to an item on the right.	
&&	Logical "AND" (Operation on binary values or results)	
II	Logical "OR" (Operation on binary values or results)	
$\oplus$	Logical "XOR" (Operation on binary values or digital values)	
[]	UML Guard condition, if and only if the guard is TRUE the respective transition is enabled	

## 297 **4 General**

296

298

303

#### 4.1 Introduction for Safety over OPC UA

- 299 Safety over OPC UA specifies a safety communication layer based on the OPC Unified Architecture.
- 300 Safety over OPC UA is an application-independent, general solution. Application-dependent companion specifications will be specified by application-experts later on (for example: robot safety,
- 302 AGVs, (Automated Guided Vehicles), etc.)

#### 4.2 Safety functional requirements

- The following requirements apply for the development of the Safety over OPC UA technology.
- 305 a) Safety communication shall be suitable for Safety Integrity Level up to SIL4 (see IEC 61508) and 306 PL e (see ISO 13849-1).
- 307 b) Combination of SIL 1 4 Safety over OPC UA devices as well as non-safety devices on one communication network.
- 309 c) Implementation of the safety transmission protocol shall be restricted to the safety layer.

- 310 d) The transmission duration times shall be monitored by the safety layer.
- 311 e) Safety communication shall meet the requirements of IEC 61784-3:2017.
- 312 f) Safety over OPC UA stack is intended for implementation in safety devices exclusively.

315

316

317

322

323

325

#### 4.3 Communication structure

Safety over OPC UA is based on:

- the standard transmission system OPC UA
- an additional safety transmission protocol on top of this standard transmission system

Safety applications and standard applications are sharing the same standard OPC UA communication systems at the same time. The safe transmission function comprises all measures to deterministically detect all possible faults / hazards that could be infiltrated by the standard transmission system or to keep the residual error rate under a certain limit. This includes

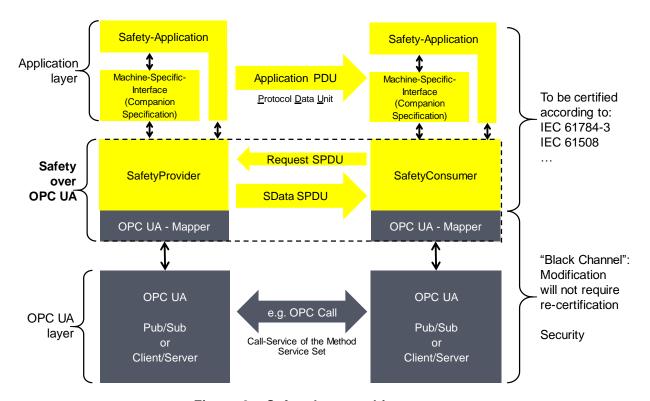

- Random malfunctions, for example due to electromagnetic interference on the transmission channel;
- Failures / faults of the standard hardware:
  - Systematic malfunctions of components within the standard hardware and software.

This principle delimits the assessment effort to the "safe transmission functions". The "standard transmission system" ("Black Channel") does not need any additional functional safety assessment.

The basic communication layers of Safety over OPC UA are shown in Figure 2.

329

328

330331

332

333

334

335

Figure 2 - Safety layer architecture

Summary of the Safety layer architecture:

#### Part: Application layer

The Safety application is either connected directly with the SafetyProvider / SafetyConsumer, or it is connected with a Machine-Specific-Interface, which is specified in a Companion Specification.

- 336 The Safety application layer shall be designed and implemented according IEC 61508.
- 337 The Safety application layer is not in the scope of this specification.

#### 338 Part: Safety over OPC UA

- 339 This layer is in the scope of this specification.
- The two basic building blocks are SafetyProvider and SafetyConsumer. These together are the SCL.
- 341 The transmission of safety data is a point-to-point communication (unidirectional). One unidirectional
- channel needs bidirectional communication, to guarantee SFRT.
- For connection establishment: a SafetyConsumer connects to the SafetyProvider with a known ID, a
- 344 SafetyProvider does not need to know the ID of the SafetyConsumer.
- 345 Error detection: a SafetyProvider is designed such it does not need error detection, the Safety-
- 346 Consumer performs all required error detection.
- 347 If the safety application at the SafetyProvider needs information from the application at the
- 348 SafetyConsumer, an additional reverse SafetyProvider SafetyConsumer connection has to be
- 349 established.
- 350 The OPC UA Mapper is used to be independent between the safety layer and OPC UA communication
- 351 "Pub/Sub" or "Client/Server".
- 352 Part: OPC UA layer
- The SafetyProvider side uses either OPC UA Server, or in the future it might be an OPC UA Publisher.
- 354 The SafetyConsumer side uses either the OPC Call service, or in the future it might be an OPC UA
- 355 Subscriber.

361

365

366

367

368

#### 356 4.4 Implementation aspects

- 357 All technical measures for error detection of Safety over OPC UA shall be implemented within the SCL
- in devices designed in accordance with IEC 61508 and shall meet the target SIL.

#### 359 4.5 Features of Safety over OPC UA

- 360 1) Runs on top of:
  - a) OPC UA Client/Server (TCP/IP) with the Method Service Set
- 362 b) The future OPC UA Pub/Sub
- 363 c) goal: no modification on existing OPC UA framework
- 364 2) Modest requirements on safety network nodes:
  - a) no clock synchronization needed (no requirements regarding the accuracy between clocks at different nodes)
  - b) to support watchdog time monitoring a sufficient accuracy of the internal timer at the SafetyConsumer is required
- 369 3) "Black Channel" principle: No functional safety requirements for non-safety network nodes and OPC UA stack
- 371 4) "Dynamic" systems:
- a) Safety communication partners may change during runtime,
- b) and/or increased/decreased in number
- 374 5) Specified diagnosis texts are used
- 375 6) Security is part of OPC UA and is not covered by this companion specification, see 4.7
- 376 7) Safety communication and standard communication shall be independent. However, standard devices and safety devices shall be able to use the same communication channel at the same time
- 378 8) Safety communication may use a single-channel communication system. Redundancy may be used optionally for increased availability
- 380 9) For diagnostic purposes, the SPDU sent and received is also stored in OPC UA variables accessible by remote read accesses, both at SafetyProvider and SafetyConsumer side
- 10) The state machines of Safety over OPC UA shall be independent from the used part of the OPC
   UA Mapper

- 384 11) Length of user data: 1-1500 bytes, structures of basic data types, see 6.3
- 385 12) Ready for Wireless transmission channels.

#### 386 4.6 Requirements on OPC UA

387 The (atomic) consistent Data exchange for the SPDU from SafetyProvider to SafetyConsumer is

- 388 required.
- 389 4.7 Security policy
- 390 In the final application an appropriate security environment needs to be in place for protecting both
- 391 the operational environment and the safety-related systems.
- For this purpose, a threat and risk analysis (TRA) according to IEC 62443 needs to be carried out on
- 393 a final application system level.
- 394 An adequate reduction of risk against malevolent attacks is a necessary prerequisite for a meaningful
- 395 application of this specification. This specification does not describe any measures which will lower
- the risk of malevolent attacks, but addresses the topic "function safety", only.
- 397 During compliance tests to this standard, security aspects are not part of the scope.

#### 398 4.8 Safety measures

- 399 For the realization of Safety over OPC UA, the following measures were chosen:
- 400 consecutive MonitoringNumber without any gaps
- 401 watchdog time monitoring with acknowledgment;
- 402 Identifier for each SafetyProvider
- 403 Signature over the structure of SData
- 404 Means to detect masquerade of SPDU from SafetyProvider with lower SIL
- 405 Cyclic redundancy check (CRC) for data integrity.
- 406 The MonitoringNumber uses a range that is large enough to secure any malfunction caused by
- 407 message storing network elements.
- 408 The watchdog time monitoring at the SafetyConsumer requires a cyclic call of the SafetyConsumer,
- 409 see Table 28.
- 410 The ID for SafetyProvider is established for authentication reasons.
- 411 These safety measures, also mentioned in Table 3, to detect possible transmission errors and are a
- 412 significant component of the Safety over OPC UA profile. The selection in Table 3 of the generic safety
- 413 measures listed in IEC 61784-3:2017, 5.5 is required for Safety over OPC UA to satisfy functional
- 414 safety requirements.
- The safety measures shall be processed and monitored within the SCL.

#### 416 Table 3 – Deployed measures to detect communication errors

	Safety measures				
Communication error	MonitoringNumber <sup>a</sup>	Timeout with receipt <sup>b</sup>	ID for SafetyProvider <sup>C</sup>	Data integrity check <sup>d</sup>	
Corruption	-	_	_	Х	
Unintended repetition	Х	Х	_	-	
Incorrect sequence	Х	_	_	-	
Loss	Х	Х	_	-	
Unacceptable delay	-	Х	_	-	
Insertion	Х	_	_	-	
Masquerade	Х	_	Х	Х	
Addressing		_	Х	-	
Out-of-sequence	Х	_	_	-	

a Instance of "sequence number" of IEC 61784-3.

The SafetyConsumer is specified that in case of communication errors according to Table 3, a defined fault reactions will occur.

If the SafetyConsumer detects a CRC error, or an MNR error, or an ID error and the error rate is lower than the limit, the state machine repeats the request, see 11.4.

In all other cases, the SafetyConsumer will deliver fail safe substitute values to the safety application instead of actual process values. In addition, an indication at the Safety Application Program Interface is set which can be queried by the safety application.

#### 4.9 OPC UA profiles for safety components

This is a placeholder section for defining different OPC UA profiles. Each profile will specify a set of mandatory and optional services, taken from this specification.

428 Components should indicate the services/roles which are implemented.

Table 4 – OPC UA profiles for safety components

	SafetyProvider	SafetyConsumer	SafetyProsumer Classic (Host)	SafetyProsumer Classic (Device)
Service Name	Provider	Consumer	Host Prosumer	Device Prosumer
ProfileA	Mandatory	Mandatory	Recommended	Optional
ProfileB	Optional	Optional	not recommended	Optional

The SafetyProvider and the SafetyConsumer are useable for controller – controller safety communication and safety communication to field level.

The SafetyProsumer Classic is compatible with PROFIsafe V2.6. This is the classic version of safety communication and is optimized for safety communication to field level.

427

b Instance of "time expectation" (Timeout) and "feedback message" (Receipt) of IEC 61784-3.

<sup>&</sup>lt;sup>C</sup> Instance of "connection authentication" of IEC 61784-3.

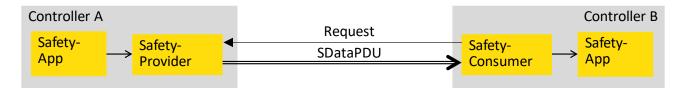

d Instance of "data integrity assurance" of IEC 61784-3, based on CRC signature.

#### 434 5 Use cases

#### 5.1 Use cases for different types of communication links

#### 5.1.1 Unidirectional communication

The most basic type of communication is unidirectional communication, where a safety application on one controller (A) sends data to a safety application on another controller (B).

439 440

441

442

443

444

445

446

447 448

449

450

451

452

453

435

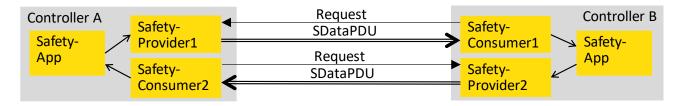

436

Figure 3 - Unidirectional Communication

This is accomplished by placing a provider on controller A, and a consumer on controller B. The connection between SafetyProvider and consumer can be established and terminated during runtime, allowing different consumers to connect to the same SafetyProvider at different times. Furthermore, the protocol is designed in such a way, that the consumer needs to know the parametrized ID of the SafetyProvider, for being able to safely check whether the received data is coming from the expected source. On the other hand, as safety data flows in one direction, only, there is no need for the SafetyProvider to check the ID of the consumers. Hence, controller A can — one after another- serve an arbitrarily large number of consumers, and new consumers can be introduced into the system without having to update controller A.

#### 5.1.2 Bidirectional communication

Bidirectional communication means exchange of data in both directions, which is accomplished by placing a SafetyProvider and a consumer on each controller. Hence, bidirectional communication is realized using two Safety over OPC UA connections.

454 455

457

Figure 4 – Bidirectional Communication

456 Connections can be established and terminated during the runtime.

#### 5.1.3 Safety Multicast

Multicast is defined as sending a set of data from one controller (A) to several other controllers (B1, B2, B3,...,BN) *simultaneously*.

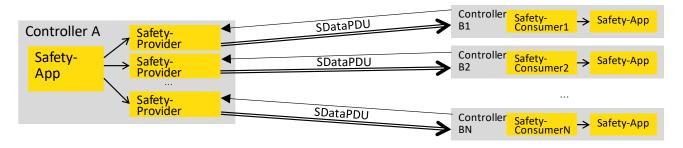

Figure 5 - Safety Multicast

466

467

468

469 470 471

472 473 474

475

476 477

478

479

480

490

504

505

Safety Multicast is accomplished by placing multiple SafetyProviders on controller A, and by connecting each of them to a consumer on one of the controllers B1, B2, ... BN, each.

The protocol Safety over OPC UA is designed in such a way that:

- the state machine of the SafetyProvider has a very low number of states, and thus very low memory demands,
- all safety-related telegram-checks are executed on the consumer, and, thus the computational demand on the SafetyProvider is very low.

Therefore, even if a large number of SafetyProviders are instantiated on a controller, the performance requirements are still moderate.

The properties of simple unicast are also valid for multicast: different sets of consumers can connect to SafetyProviders at different times, and new consumers can be introduced into the system without having to reconfigure the SafetyProvider instances. As the SafetyProvider instances send data from the same Safety application (same data source), it is irrelevant from a safety point of view to which actual SafetyProvider instance each of the consumers is connected. Thus, all SafetyProvider instances can be parametrized with the same SDataProvID and same SDataBaseID.

## 5.2 Cyclic and acyclic safety communication

- 481 Safety over OPC UA supports cyclic and acyclic safety communication.
- Usually safety applications with safety communication require to communicate a demand. In these applications a cyclic safety communication must be established. That means after evaluation of the
- 484 SData at the safety application at SafetyConsumer side, the time until the next call of the
- SafetyConsumer shall be limited. This limitation time is part of the SFRT.
- But in some safety applications a SafetyConsumer requires to read safety data but not a demand. This
- requirement can be fulfilled by acyclic safety communication. This acyclic safety communication uses
- a temporal time monitoring for the response (as SDataPDU) to the RequestSPDU.
- The function for acyclic safety communication can be reused to implement the cyclic request.

#### 5.3 Principle for "Application Variables with qualifier"

- 491 Every single safety variable shall add a safety qualifier to inform the SafetyConsumer Application
- 492 Program whether the value is good or bad. The Qualifier shall be synchronous and consistent with the 493 Value.

#### 494 Table 5 – Example "Application Variables with qualifier"

Value	Qualifier
valid	0x1 (= good)
not valid	0x0 (= bad)

495 496 Motivation

- Motivation for "Application Variables with qualifier":
- This principle allows an individual safety reaction for that safety function, which is impacted by the failed safety variable.
- The Qualifier shall be checked at safety application due to application specific reasons.
- Exception: In safety applications where the value "0" at the variable leads to the safe state, the variable can be used without checking the Qualifier.
- The presentation format for the Qualifier for single SData (Variable) will be specified in a separate companion standard. This is not in the scope of this standard.

#### 6 Information Model

#### 6.1 Example ObjectType Definition

The NamespaceUri of Safety over OPC UA is <a href="http://opcfoundation.org/UA/Safety">http://opcfoundation.org/UA/Safety</a>.

507 Under this URL the Nodeset plus the list of nodes including the Nodelds can be found.

508 Each server has a singleton folder called SafetyDeviceSet with a fixed Nodeld in the namespace of 509 safety over OPC UA. Because all SafetyProviders on this server comprise a nonhierarchical reference to this variable, it can be used to directly access all SafetyProviders by following the references in 510 backward direction.

511

In addition, the servers comprise one OPC UA object derived from type SafetyProviderType for each 512 513 SafetyProvider they implement. The corresponding information model is shown in Figure 9.

514 A description of the graphical notation for the different types of Nodes and References (shown in Figure 6, Figure 7, Figure 8, and Figure 9) can be found in OPC UA Part 3 Annex C. 515

516 Figure 6 shows the Safety Parameters for SafetyProvider.

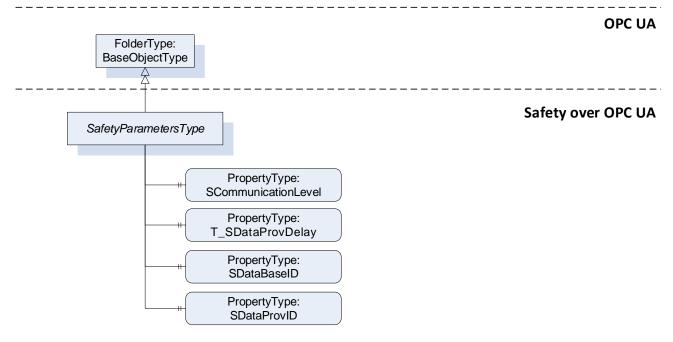

Figure 6 - Safety over OPC UA Parameters for SafetyProvider

Figure 7 describes SafetyProvider Type.

519 520 521

517

518

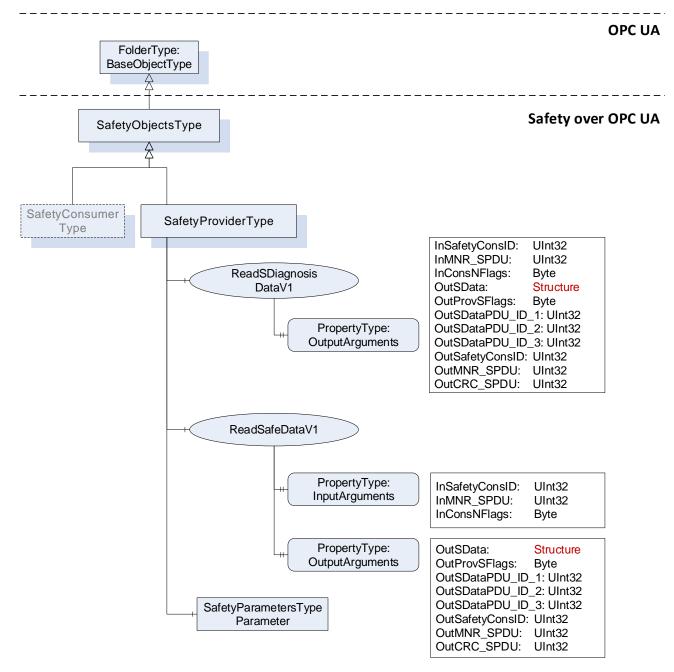

Safety over OPC UA requires (atomic) consistent data exchange.

522 For Safety over OPC UA, the Call-Service of the Method Service Set (see OPC Unified Architecture, 523 Part 4: Chapter 5.11.2 Call) is used. The Call-Service supports the consistent Data exchange. The 524 Method "ReadSafeDataV1" uses the OPC UA-Server with a set of InputArguments that make up the RequestSPDU and a set of OutputArguments that make up the SDataPDU. The "SafetyConsumer" 525 uses the OPC UA-Client with the OPC UA Service Call. 526

For diagnostic purposes, the SPDU received and sent is accessible by calling the method ReadDiagnosisDataV1.

529

527

531532

533

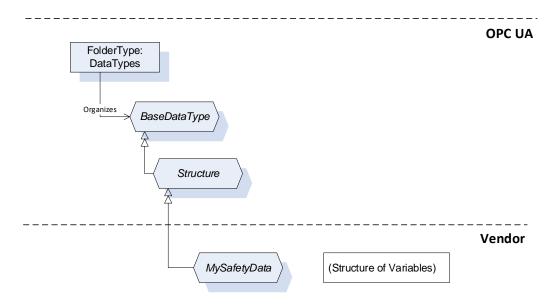

534 535

Figure 7 - Server Objects for Safety over OPC UA

NOTE The Model of the SafetyConsumer is not required at this stage of companion specification as a SafetyConsumer application has to know from the safety point of view all relevant information of the SafetyProvider. It can be added for Diagnosis.

Figure 8 shows the vendor specific definition of safety data.

539

540541

Figure 8 – DataTypes for Safety over OPC UA

542

543 544 545

549

Figure 9 shows the Instances of server objects for Safety over OPC UA. There are two things worth noting:

- 546 547 548
- contains the concrete DataType of the SafetyData.

  The Property SDataBaseID is shared for all SafetyProviders with the same SDataBaseID value.

The ObjectType for the SafetyProvider contains the methods with the abstract DataType

BaseDataType. Each instance of a SafetyProvider needs its own copy of the methods which

#### 6.1.1 Method ReadSafeDataV1

This method reads safe data from the SafetyProvider.

#### 558 Signature

```
559
          ReadSafeDataV1 (
560
               [in] InMNR SPDU

590
         );
```

- 591 For the description of the arguments see Method ReadSafeDataV1, see Table 8.
- Instances of SafetyProviderType shall use non-abstract DataTypes for the OutSData argument.
  - 6.2 Safety over OPC UA Version
- The Version of the SafetyProvider is represented in the name of the two methods ("V1").

## 6.3 DataTypes

Safety over OPC UA allows for sending the following basic data types listed in OPC UA within the SData (see OPC UA Part 3 - Address Space Model, Chapter BaseDataType and Part 6 - Mappings, Table – Built-in DataTypes).

600 Table 9 - DataTypes for Safety over OPC UA

ID	DataType name	value range	Number of octets	Description
1	Boolean (true or false)	0x0, 0x1	1	Using any other value than 0x1 for "true" may result in spurious errors in the cyclic redundancy check.
3	Byte	0 255	1	
4	Int16	-32 768 32 767	2	
6	Int32 / same for Enumeration	-2 147 483 648 2 147 483 647	4	
5	UInt16	0 65 535	2	
7	UInt32	0 4 294 967 295	4	
10	Float32 (ISO/IEC/IEEE 60559:2011)	single precision (32 bit) floating point value	4	

601 Currently, only scalar data types supported. No arrays are supported.

#### 6.4 Connection establishment

Safety over OPC UA uses the OPC UA services for session establishment. For connection establishment Safety over OPC UA needs no additional requirement to these services.

This version of the specification includes configuration only at engineering time.

## 7 Safety communication layer services and management

#### 7.1 Overview

607

608

Figure 10 gives an overview of the safety communication layer and its interfaces. It thereby also shows the scope of this specification. The main function of the Safety over OPC UA layer services is the state machine which handles the protocol. (As the Safety over OPC UA state machines are not influenced by OPC UA means it is described in UML). The state machines have several interfaces.

- The Safety Application Program Interface (SAPI) to control the safety data.
- The Safety Parameter Interface (SPI) supports adoption to the requirements of the application.
- The Diagnosis Interface (DI) supports the troubleshooting of the safety communication.
- the OPC UA platform interface (OPC UA PI) to the OPC UA stack.
- These interfaces are vendor specific.

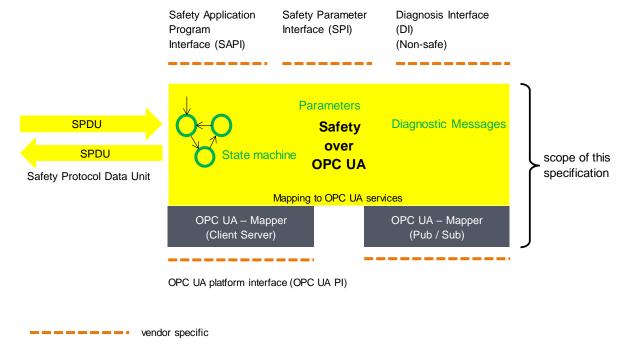

Figure 10 - Safety communication layer overview

618619

625

626

627

628

#### 7.2 Platform interface (OPC UA PI)

The state machines of Safety over OPC UA are independent from the used Part of the OPC UA Data Access. For this reason, the so called OPC UA Mapper is introduced.

One part of the OPC UA Mapper is the Method ReadSDiagnosticDataV1.

#### 7.3 SafetyProvider interfaces

The Figure 11 shows an overview of the SafetyProvider interfaces. The SAPI is specified in 7.3.1, the SPI is specified in 7.3.2.

## Safety Application Program Interface (SAPI)

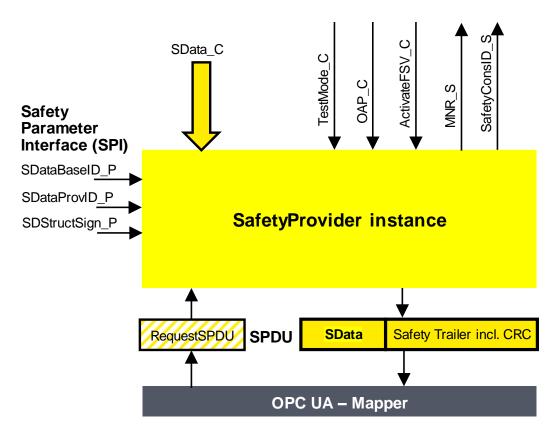

Figure 11 - SafetyProvider interfaces

## 631

632

633 634

635

629630

### 7.3.1 SAPI of SafetyProvider

The SAPI of the SafetyProvider represents the Safety communication layer services of the SafetyProvider. Table 10 lists all inputs and outputs of the SAPI of the SafetyProvider.

Table 10 - SAPI of the SafetyProvider

SAPI Term	Туре	Definition	
SData_C	MySafeData	This input is used to accept the user data which is then transmitted as SDa in the SPDU.	
		NOTE: Whenever a new MNR is received from a SafetyConsumer, the state machine for the SafetyProvider will read a new value of the SData_C from its corresponding Safety Application and use it until the next MNR is received.	
		NOTE: If no valid user data is available at the Safety Application, ActivateFSV_C shall be set to "1".	
TestMode_C	Boolean	By setting this input to "1" the <b>remote</b> SafetyConsumer is informed that the SData are test Data, and should not be used for safety related decision.	

SAPI Term	Туре	Definition	
		NOTE: The Safety over OPC UA stack is intended for implementation in safety devices exclusively, see 4.2.	
OAP_C (Operator Acknowledge Provider)	Boolean	By changing this input to "1" (rising edge) after request for OA (OA_Req_S==1) at the <b>remote</b> SafetyConsumer, the SafetyConsumer is able to resume the SData from FSV to PV, see A.2.4.	
ActivateFSV_C	Boolean	By setting this input to "1" the SafetyConsumer will deliver FSV instead of PV to the safety application program.  NOTE: The "1" value is purposely used to guard against the case where an entire message is all 1's due to some faulty hardware.  NOTE: if the replacement of process values by FSV should be controllable in a more fine-grained way, this can be realized by using qualifiers within the SData, see 5.3.	
MNR_S	UInt32	This output yields the MNR. The MNR_S in the safety application is updated when a new request comes in from the SafetyConsumer.	
SafetyConsID_S	UInt32	This output yields the ConsumerID used in the last access to this SafetyProvider by a SafetyConsumer.	

637

638

#### 7.3.2 SPI of SafetyProvider

The SPI of the SafetyProvider represents the parameter of the Safety communication layer management of the SafetyProvider.

639640

Table 11 - SPI of the SafetyProvider

Name	Туре	Range	Note
SDataBaseID_P	GUID	See GUID	See 8.1.1.6
SDataProvID_P	UInt32	1 - 0xFFFFFFF	See 8.1.1.7
SDStructSign_P	UInt32	1 – 0xFFFFFFF	Signature of the SData structure, see 8.1.1.2

641

642

643

644

645

646

647

## 7.3.3 Characteristics of SafetyProvider

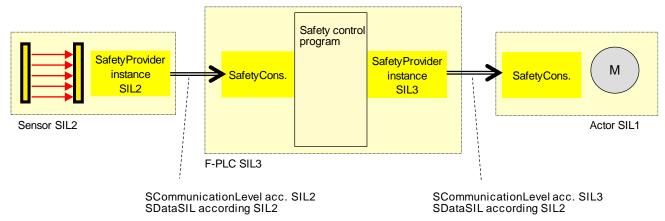

The property value T\_SDataProvDelay has no influence on the functional behavior of the SafetyProvider. However, it will be provided in its OPC UA information model of a SafetyProvider for engineering purposes.

The property value SCommunicationLevel gives coding for the SCommunicationLevel\_ID to calculate the SDataPDU\_ID.

648

Table 12 - Properties of SafetyProvider

Name	Туре	Range	Note
T_SDataProvDelay	UInt32	1 – 0xFFFFFFF	In microseconds (µs). It can be set in the engineering phase of the SafetyProvider or set during online configuration as well.
			T_SDataProvDelay is the maximum time at the SafetyProvider from receiving the RequestSPDU to start the transmission of SDataSPDU, see 10.2.
SCommunicationLevel	Byte	1 - 4	The maximal SIL the SafetyProvider implementation (hardware & software) is capable of, see Figure 12.
			It is used to inform the SafetyConsumer to parametrize the appropriate SCommunicationLevel_IP and then to generate the appropriate. SCommunicationLevel_ID NOTE: It is independent from the generation of the SData at SAPI.

650 Figure 12 – Example combinations of SIL capabilities

652 653

The SIL capability of the SafetyConsumer implementation is independent on the SIL capability of the SafetyProvider implementation (SCommunicationLevel).

654 655 656

657

A SafetyConsumer implementation with a SIL 1, or 2, or 3, or 4 may accept SPDUs from SafetyProvider with a capability of SIL 1, or 2, or 3, or 4.

# 7.4 SafetyConsumer interfaces

The Figure 13 shows an overview of the SafetyProvider interfaces. The SAPI is specified in 7.4.1, the SPI is specified in 7.4.3.

# Safety Application Program Interface (SAPI) SData\_S (PV or FSV) SDataBaseID\_ SDataProvID\_ **Safety** Enable **Parameter** Interface (SPI) SDataBaseID P SDataProvID\_P SafetyConsID\_P SDStructSign\_P TO\_SoOPC\_P SafetyConsumer instance OA\_Necessary\_P T\_ErrRateTol\_P SCommunicationLevel\_ **SData** Safety Trailer incl. CRC RequestSPDU **SPDU OPC UA - Mapper**

# Figure 13 - SafetyConsumer interfaces

# 7.4.1 SAPI of SafetyConsumer

The SAPI of the SafetyConsumer represents the Safety communication layer services of the SafetyConsumer. Table 13 – SAPI of the SafetyConsumer lists all inputs and outputs of the SAPI of the SafetyProvider.

Table 13 - SAPI of the SafetyConsumer

SAPI Term	Туре	Definition	
SData_S	MySafeData	This output ether delivers the process values received from the SafetyProvider in the SPDU field SData, or FSV.	
Enable_C	Boolean	By changing this input to "0" the SafetyConsumer will change each and every variable of the SData to "0" to stop sending requests. When changing Enable_C to "1" the SafetyConsumer will restart safe communication. The variable can be used to delay the start of the Safety over OPC UA communication, after power on until "OPC UA connection ready". The delay time is not monitored.	
FSV_Activated_S	Boolean	This output indicates via "1", that on the output SData_S FSV (all binary "0") are provided.  NOTE: if an application needs different FSV than "all binary 0", it should use appropriate constants instead of the output of SData_S, in case FSV_Activated_S is set.	

SAPI Term	Туре	Definition	
OAC_C	Boolean	Motivation for Operator Acknowledge see 7.4.2.	
(Operator Acknowledge Consumer)		After an indication of OAC_Req_S this input shall be changed by means of the operator. By changing this input from "0" to "1" (rising edge) the SafetyConsumer is instructed to switch SData from FSV to PV. The OAC_C is processed only if this rising edge arrives after OAC_Req_S is set to "1", see Figure 22.	
		If a rising edge of OAC_C arrives before OAC_Req_S becomes 1, this rising edge is ignored.	
		As soon as the OAC_Req_S is reset to "0" the OAC_C shall also be set to "0" by the safety application.	
OAC_Req_S	Boolean	This output indicates the request for operator acknowledgment. The bit is set to "1" by the SafetyConsumer, after the rate of error has been too high and now the communication runs error free and hence operator acknowledgement is possible. The bit is reset to "0", when a rising edge at OAC_C is detected	
OAP_Req_S	Boolean	This output indicates an operator acknowledgement has taken place on the SafetyProvider. If operator acknowledgement at the SafetyProvider should be allowed this output must be connected to OAC_C, see A.2.4 and A.2.5.	
TestMode_S	Boolean	Every SafetyConsumer application program shall evaluate this variable. This output indicates by "1" that the application at the SafetyProvider is in the state "TestMode", e.g. during commissioning. A value of "0" represents the "normal safe state".  Motivation: The TestMode enables the programmer and commissioner to validate the application with test data.	
SDataProvID_C	UInt32	By changing this input to a non-zero value, the SafetyConsumer uses this variable instead of the SPI-Parameter SDataProvID_P. This input is only read in the first cycle, or when a rising edge occurs at the input Enable_C. See also Table 14. If it is changed to "0", the Parameter SDataProvID_P will become activated.	
SDataBaseID_C	GUID	By changing this input to a non-zero-value the SafetyConsumer uses this variable instead of the SPI-Parameter SDataBaseID_P. This input is only read in the first cycle, or when a rising edge occurs at the input Enable_C. See also Table 14. If it is changed to "0", the Parameter SDataBaseID_P will become activated.

677

678

679

680

# 7.4.2 Motivation for SAPI Operator Acknowledge (OAC\_C)

NOTE The characteristic of Operator Acknowledge is used to limit directly the rate of detected faulty SDataPDUs and indirectly the rate of undetected faulty SDataPDUs entering the SafetyConsumer (see 11.4).

As long as communication errors are detected too frequent the SafetyConsumer continuously delivers FSV. When communication errors are no longer detected, the SafetyConsumer will return to deliver PV <u>after</u> an Operator Acknowledge.

Operator Acknowledge must be initiated by a human operator as he is responsible to check the installation, see "Table 28, row Operator Acknowledge". For this reason the OAC\_C is pushed up to the safety application program to deal with.

Timeout errors do not need OAC\_C. As an option, if setting OA\_Necessary\_P==1 then the use of OAC\_C is required.

# 7.4.3 SPI of SafetyConsumer

The SPI of the SafetyConsumer represents the parameter of the Safety communication layer management of the SafetyConsumer.

Table 14 - SPI of the SafetyConsumer

SPI Name	Туре	Range / Default	Note	
SDataBaseID_P	GUID	See GUID	See 8.1.1.6  If the Parameter SDataBaseID_P can be changed by the Safety Application Program, then it can be combined with the interface variable SDataBaseID_C	
SDataProvID_P	UInt32	1 - 0xFFFFFFFF	F See 8.1.1.7 If the Parameter SDataProvID_P can be changed by the Safety Application Program, then it can be combined with the interface variable SDataProvID_C	
SafetyConsID_P	UInt32	1 - 0xFFFFFFF	See 8.1.1.8	
SDStructSign_P	UInt32	1 – 0xFFFFFFF	32 bit signature of the SData structure See 8.1.1.2	

TO_SoOPC_P	UInt32	1 – 0xFFFFFFF Default value 1	In µs SPDU WatchDog time period at SafetyConsumer from request to response with error free SDataPDU or in case of an SPDU-error. See 10.2
OA_Necessary_P	Boolean	0 / 1 Default 1	This parameter controls whether an OA is necessary in case of timeout (TO_SoOPC_P) or when the SafetyProvider has activated FSV (ActivateFSV_C).  1: in case of timeout, or ActivateFSV_C the values remain in FSV until OA.  0: in case of timeout (TO_SoOPC_P), the values change from FSV to PV as soon as the communication is free of errors. In case of ActivateFSV_C the values change from FSV to PV as soon as ActivateFSV_C returns to "0".
T_ErrRateTol_P	UInt16	6, 60, 600	Value in minutes. The parameter T_ErrRateTol effects the maximum tolerated rate of errors detected by Safety over OPC UA and therefore the PFH of this Safety over OPC UA link, see 11.4
SCommunicationLevel_P	Byte	1 - 4	This parameter represents the SIL of a SafetyProvider instance, from 1 to 4. This parameter gives Coding for the SCommunicationLevel_ID to calculate the SDataPDU_ID. See 8.1.1.11and Figure 12

682

687

690

# 7.4.4 Motivation for SPI OA\_Necessary\_P

- This parameter shall be set to 1 at application where recovery only by human interaction is permitted.
- This parameter shall be set to 0 at application where auto recovery (without human interaction) is permitted.

### 686 7.5 OPC UA platform interface for SafetyProsumer Classic

### 7.5.1 SafetyProsumer Classic (Host) services and parameter

The SafetyProsumer Classic (Host) will be conform to the behavior of IEC 61784-3-3 Ed3. Its integration in OPC UA will be described in the next version of this specification.

# 7.5.2 SafetyProsumer Classic (Device) services and parameter

The SafetyProsumer Classic (Host) will be conform to the behavior of IEC 61784-3-3 Ed3. Its integration in OPC UA will be described in the next version of this specification.

# 8 Safety communication layer protocol

# 8.1 SafetyProvider and SafetyConsumer

#### **8.1.1 SPDU format**

#### **8.1.1.1 SPDU summary**

Figure 14 shows the structure a RequestSPDU which originates at the SafetyConsumer and contains a SafetyConsID, a MonitoringNumber (MNR\_SPDU), and one byte of (non-safety-related) flags (ConsNFlags).

NOTE: The ConsNFlags are named "NFlags" (non safety) in opposite to the "SFlags" in the SDataPDU, as the SFlags in this specification are safety-relevant.

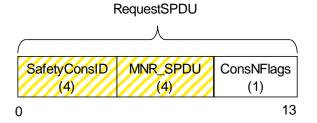

Figure 14 – RequestSPDU

 NOTE The SafetyConsID and the MNR\_SPDU are not safety relevant in the RequestSPDU, they become safety relevant as part of the SDataPDU. For this reason, they are crosshatched in the RequestSPDU.

NOTE The RequestSPDU does not need an own different BaseID as in Safety over OPC UA the SDataBaseID is enough from the safety point of view in the specified design.

Figure 15 shows the structure of a SDataPDU which originates at the SafetyProvider and contains the safety data (1 – 1500 Byte) and additional 25 Byte safety code (STrailer) as described in the subsequent sections.

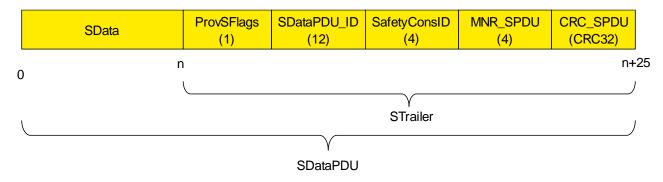

Figure 15 - SDataPDU

(x) lists the number of bytes in the SPDU part.

 In order to avoid spurious trips, the SPDU must be transmitted in an atomic (consistent) way from the OPC UA platform interface of the SafetyProvider to the OPC UA platform interface of the SafetyConsumer. This is the task of the respective OPC UA mapper, see Figure 2.

# 8.1.1.2 SData

SData contains the safety-related application data transmitted from provider to consumer. It may comprise multiple basic OPC UA variables taken from Table 6. Note that SData should be collected in a Structure.

- 728 For the calculation of the CRC Signature, the order in which this data is processed by the calculation,
- 729 is important. Provider and Consumer have to agree upon the number, type and order of application
- data transmitted in SData. The sequence of the SData is fixed. 730

NOTE SData may contain qualifier bits for a fine grained activation of fail-safe substitute values. For a valid process value,

the respective qualifier should be set to 1 (good), whereas the value 0 (bad) should be used for invalid values. Invalid process 733

values must be replaced by a fail-safe substitute value in the consumer's safety application. See Table 4

734 735

#### 8.1.1.3 ConsNFlags: Flags of the Safety Consumer

736 The value of the ConsNFlags carries the flags according to Table 15.

#### 737

### Table 15 - Structure of ConsNFlags

NFlag Bit nr.	Name	Description
LSB =	SComErrDiag_NF	0: No error
Bit 0		1: A communication error occurred in the previous SDataPDU.
Bit 1	OAC_Req_NF	Equivalent of OAC_Req_S to inform the SafetyProvider
Bit 2	FSV_Activated_NF	Is used for conformance test of FSV_Activated_S
Bit 37	Reserved for future use	

- 738 The SafetyConsumer sets SComErrDiag\_NF to enable a communication analysis tool to trigger in case 739 of an error.
- The N of \_NF stands for non safety. These flags are not evaluated at the SafetyProvider. 740
- 741 All other bits in ConsNFlags are reserved for future use. They must be set to zero by the 742 SafetyConsumer and must not be evaluated by the SafetyProvider.

#### 743 8.1.1.4 ProvSFlags: Flags of the SafetyProvider

The byte ProvSFlags carries the bits shown in Table 16 744

#### 745

Table 16 - Structure of ProvSFlags

CEIn at Dit and	Name	Description
SFlag Bit nr.	Name	Description
LSB =	OAP_SF	See OAP_C
Bit 0		
Bit 1	ActivateFSV_SF	See ActivateFSV_C
Bit 2	TestMode_SF	See TestMode_C
Bit 3 7	Reserved for future use	

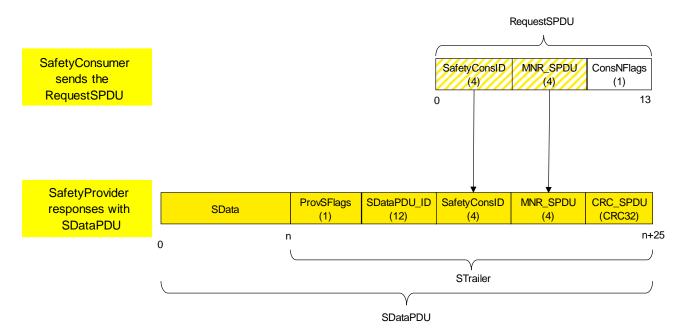

- 746 The SafetyConsumer evaluates the ProvSFlags and transmits the info to the SAPI if the SDataPDU is 747 checked without error.
- 748 The S of SF stands for safety related.
- If the SDataPDU is checked with error: TestMode\_C:=0, ActivateFSV\_C:=1, OAP\_SF remains last 749
- value. If the SDataPDU is checked without error: TestMode\_C:= TestMode\_SF, and OAP\_C:= 750
- OAP\_SF. 751

#### 752 8.1.1.5 MonitoringNumber (MNR)

- 753 The SafetyConsumer uses the MNR (MNR\_SPDU together with the SafetyConsID) to check whether
- 754 the SDataPDU is the response to the RequestSPDU sent earlier. The MNR\_SPDU is used in the
- acknowledgment mechanism for monitoring the propagation delay from SafetyProvider to 755
- SafetyConsumer. 756
- 757 Safety over OPC UA is transmitting the MNR with each and every SPDU as MNR\_SPDU.
- 758 The checking for correctness of the MNR\_SPDU is performed by the SafetyConsumer.

- 759 With each request, the MNR is incremented. In case of an overflow (0xFFFFFFFF + 1) the MNR\_SPDU
- 760 is set to MNR\_min. Values between 0 and MNR\_min are reserved.
- 761 MNR min is 0x100.
- 762 NOTE: these reserved values can be used in the future e.g. to transmit information from SafetyConsumer to SafetyProvider.
- 763 Example sequence for MNR:
- 764 ..
- 765 0xFFFF FFFE
- 766 0xFFFF FFFF
- 767 0x0000 0100
- 768 0x0000 0101
- 769 ...

- 771 Refer to 11.2 for relevant constraints.
- 772 8.1.1.6 SDataBaseID
- 773 The SDataBaseID is used as one global ID for a set of SafetyProviders with unique SDataProvID, see
- 774 3.2.24
- 775 Refer to 11.1.1 for relevant constraints.
- 776 **8.1.1.7 SDataProvID**
- 777 The SDataProvID is the ID for the individual SafetyProvider. See 3.2.25
- 778 In case of a machine-type every machine may have the same set of SDataProvIDs. In this case the
- 779 SDataBaseID shall be set up for every machine instance individually.
- 780 Refer to 11.1.1 for relevant constraints.
- 781 **8.1.1.8 SafetyConsID**
- 782 Identifier of the SafetyConsumer instance.
- 783 Refer to 11.1.2 for relevant constraints.
- 784 **8.1.1.9 Build SDataPDU**
- 785 The task of the SafetyProvider is to take over the MNR\_SPDU and the SafetyConsID of the received
- 786 RequestSPDU into the STrailer. After this, it adds the SDataPDU ID, ProvSFlags, and the SData to
- 787 calculate the CRC\_SPDU (see 8.1.1.9).

791

793

789 Figure 16 – Overview of task for SafetyProvider

790 Calculation of the SDStructSign see 8.1.1.12

792 Coding of the SDataBaseID, see 8.1.1.6

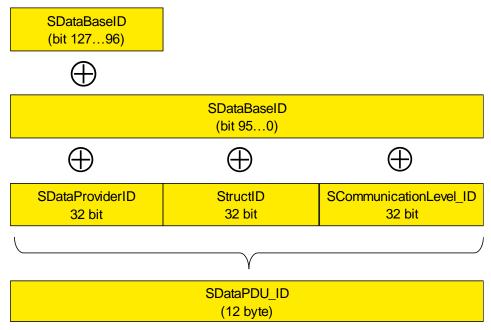

794 Coding of the SDataProvID, see 8.1.1.7

795

796

# 8.1.1.10 Calculation of the SDataPDU\_ID

797 Figure 17 shows the calculation of the SDataPDU\_ID.

798

799

Figure 17 - Calculation of the SDataPDU\_ID

The SDataPDU\_ID is calculated according Table 17.

# Table 17 - Presentation of the SDataPDU\_ID

SDataPDU_ID (bit 31 0) := SDataBase_ID (bit 31 0) XOR SCommunicationLevel_ID		
SDataPDU_ID (bit 63 32) := SDataBase_ID (bit 63 32) XOR SDStructSign		
SDataPDU_ID (bit 95 64) := SDataBase_ID (bit 127 96) XOR SDataBase_ID (bit 95 64) XOR SDataProvID		

# 8.1.1.11 Coding of the SCommunicationLevel\_ID

# Table 18 - Coding for the SCommunicationLevel\_ID

Property	Value of SCommunicationLevel_ID
Internal equivalent of the SCommunicationLevel	SIL 1 communication: 0x11912881 SIL 2 communication: 0x647C4654 SIL 3 communication: 0xDEAA9DEE SIL 4 communication: 0xAB47F33B

These values of SCommunicationLevel\_ID differ by maximum number of bits (hamming distance of 21).

A SafetyProvider shall know only the one appropriate value (Internal equivalent value of the SCommunicationLevel) especially as SafetyProvider with SIL 1-3 to be not able to choose a wrong one (like equivalent for used for SIL 4 / SCommunicationLevel==4) by errors.

It shall be set equivalent to the SIL capability of the SafetyProvider instance.

The SCommunicationLevel is independent to the SIL capability of the provided SData.

# 8.1.1.12 SDataStructure Signature (SDStructSign)

- The SDStructSign is used to check the number, type and order of application data transmitted in SData.
- 821 If the SafetyConsumer is expecting, anything different than the SafetyProvider provides, the
- 822 SDStructSign will differ, allowing the SafetyConsumer to enable fail-safe substitute values.
- 823 In addition, applications may also define a 32-bit SData-ID which will allow for the discrimination of
- 824 data which is otherwise not differentiable. For instance, three integers could be interpreted as
- cartesian coordinates or three Euler angles. By defining a SData-ID for each of the two types, online
- detection of a mismatch becomes possible.
- 827 SData-IDs which are defined in application specific companion specifications published by the OPC
- Foundation should have their highest bit set to 0 (range 0x80000000 to 0xFFFFFFFF). Other SData-
- IDs should have their highest Bit set to 1 (range 0x00000001 to 0x7FFFFFFF). The value 0x00000000
- 830 shall be used if no SData-ID has been defined.
- 831 The SDStructSign is calculated as CRC32-signature over the SData-ID, the version of presentation
- and the sequence of the DataType IDs. After each datatype ID, a 16-bit zero-value (0x0000) is inserted.
- 833 Example of a SDStructSign:
- 834 ID of companion specification for Safety over OPC UA (0xyyyyy, 0xzzzz),
- Version of list presentation for SDStructSign:= 0xvvvv,
- 836 1. DataType Int16: (Id = 4),
- 837 2. DataType Boolean: (Id = 1),
- 838 3. DataType Float32: (ld =10)
- 839 840 SDStructSign== CRC32(0xyyyyy, 0xzzzz, 0xvvvv, 0x0000, 0x0004, 0x0000, 0x0001, 0x0000, 841 0x000A)

842

- NOTE: The insertion of 0x0000 values before the DataType ID, allows for introducing arrays in later version of this specification.
- The DataType ID can be found at the DataType or at the derived DataType.
- The OPC UA Information model supports not only built-in DataTypes, but also from these DataTypes
- derived from built-in DataTypes. In case of derived DataTypes, the Data Structure CRC uses the ID of
- a built-in DataType is used (which is found at the end of the tree).
- The base type "enumeration" uses the DataType Int32 (ID=6); for therefore, this specification uses in
- 850 case of "DataType enumeration" the ID for Int32.
- 851 In the first version of this specification arrays are not supported. Instead, multiple variables of the
- same type must be used.
- 853 **8.1.1.13 CRC\_SPDU**
- The SafetyProvider calculates the CRC signature (CRC\_SPDU) and sends it to the SafetyConsumer
- as part of SPDU. This enables SafetyConsumer to check the correctness of the SPDU including the
- SData, ProvSFlags, MNR, and the SDataPDU\_ID by recalculating the CRC signature.
- The generator polynomial *0xF4ACFB13* shall be used for the 32 bit CRC signature.
- 858 If SData is longer than one byte (e.g. UInt16; Int16, Float32), it shall be decoded and encoded using
- 859 big-endian integers in which the least significant byte appears last in the incremental memory address
- 860 stream.
- 861 The calculation sequence shall begin with the highest memory address (n) of the SData counting back
- to the lowest memory address (0) and then include also the STrailer beginning with the highest memory
- 863 address.
- Figure 18 shows the calculation sequence of the CRC\_SPDU.

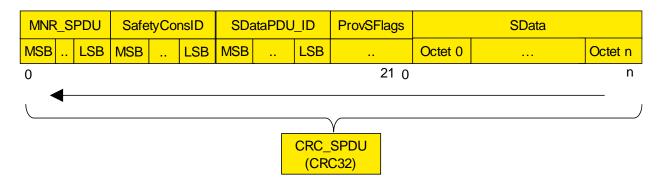

Figure 18 - Calculation of the CRC\_SPDU

It is allowed to calculate the CRC of the SData and take this CRC as start value for the CRC calculation of the STrailer.

876

# 8.1.2 Safety over OPC UA behavior

#### 8.1.2.1 General

The core of the safety layers is within the SafetyProvider and SafetyConsumer. The SafetyProvider and SafetyConsumer are specified in state diagrams.

877

Table 19 - Definition of terms used in the state diagrams

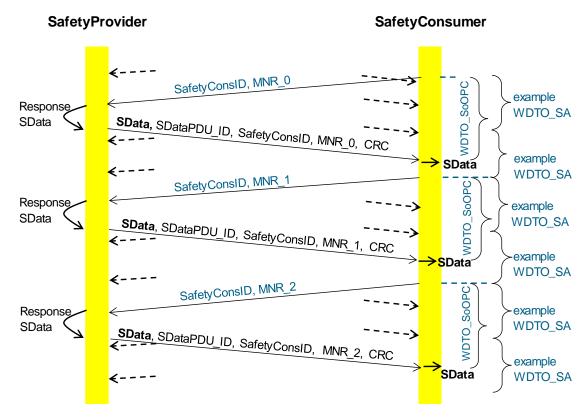

Term	Definition
Initial values	Any SPDU values =0
SPDU received	Any new SPDU received; ignore SPDU with all values = 0  NOTE this is executed in the macros <get requestspdu=""> and <get sdatapdu=""></get></get>
CRC_SPDU	CRC as part of the SPDU, Range 1 0xFFFFFFFF
MNR_SPDU	MNR as part of the SPDU, Range see 8.1.1.5
RequestSPDU	Structure: SafetyConsID, MNR

878

879

# 8.1.2.2 SafetyProvider/-Consumer Sequence diagram

Figure 19 shows the sequence of request and response with SData and the timeouts for Safety over OPC UA.

882

883

885 886

887

888

889

Figure 19 - Sequence diagram for Safety over OPC UA

The WDTO\_SoOPC is the watchdog time for Safety over OPC UA.

The WDTO\_SA is the maximum time for the cyclic update of the SafetyConsumer. It is the timeframe from one call of the SafetyConsumer to the next call of the SafetyConsumer. The implementation and error reaction of WDTO\_SA is not part of this specification, it is vendor specific.

The short-dashed arrows show possible repetitions of SPDUs at the black channel, especially with Pub/Sub.

The long arrows show the new SPDU.

The WDTO\_SoOPC monitors the timeframe from "<Set RequestSPDU>" to the OPC UA

Communication Stack" to "accept the SDataPDU" (all checks for authenticity, timeliness and data

Figure 20 - Principle state diagram for SafetyProvider

The transitions are fired in case of an event for example receiving a SPDU. In case of several possible transitions, so-called guard conditions (refer to [...] in UML diagrams) define which transition to fire.

The diagram consists of activity and action states. Activity states are surrounded by bold lines, action states are surrounded by thin lines. While activity states may be interruptible by new events, action states are not. External events occurring while the state machine is in an action state, are deferred until the next activity state is reached.

Table 22 - SafetyProvider instance internal items

INTERNAL ITEMS	TYPE	DEFINITION
RequestSPDU_i	Variable	Local Memory for RequestSPDU
state_x	Activity State	Within these interruptible "activity" states the SafetyProvider waits for new inputs.
state_y	Action State	Within these non-interruptible "action" states events like new Request is deferred until the next "activity" state [1] is reached.
<get requestspdu=""></get>	Macro	Instruction to take the whole RequestSPDU from the OPC UA Mapper.
<set sdatapdu=""> Macro</set>		Instruction to transfer the whole SDataPDU to the OPC UA Mapper
<bul><li><build sdatapdu=""></build></li><li>Macro</li></bul>		Take the MNR_SPDU and the SafetyConsID of the received RequestSPDU. Add the SDataPDU_ID, ProvSFlags, and the SData to calculate the CRC_SPDU. See 8.1.1.9

# 8.1.2.4 SafetyConsumer state diagram

- 914 Figure 21 shows the principle state diagram of the SafetyConsumer. Use Table 24,
- 915 Table 25, and Table 23 for implementation and test.

916

917

Figure 21 - principle state diagram for SafetyConsumer

Table 23 – SafetyConsumer driver internal items

INTERNAL ITEMS	TYPE	DEFINITION	
Variable / Flag	ag		
FaultReqOA_i	SFlag	Local memory for errors which request Operator Acknowledge.	
OAC_i	SFlag	By means of this auxiliary variable (bit) a rising edge of OAC_C is memorized.	
OAC_Req_S	Interface / SFlag	It is used at the Interface and at the same time for internal logic.	

INTERNAL ITEMS	TYPE	DEFINITION	
prevMNR_i	Variable	Local memory for previous MNR	
SDataProvID_i	Variable	Local memory for SDataProvID in use	
Timer			
WDTO_SoOPC	Timer	This timer is used to check whether the next valid SDataPDU arrived on time.	
T_ErrRateTol	Timer	The CountdownTimer T_ErrRateTol is set to the value T_ErrRateTol_P.	
		The first detected "SDataPDU error" starts the CountdownTimer T_ErrRateTol.  It stops at 0.	
		Only if a second "SDataPDU error" is detected before it stops the SData_S change to FSV.	
		The CountdownTimer T_ErrRateTol is started after Start / Restart of the safety communication, too.	
		The timer value is related to the residual error probability described later, as a different PFH is used to correlate between different timeout value settings for the enforcement of a BER at the safety layer.	
		"SDataPDU error" consists of CRC error and an MNR error and an ID error (SDataPDU_ID, SafetyConsID).	
Identifier			
Diagldentifier	Pointer	See Table 26	
Macros <>			
<get sdatapdu=""></get>	Macro	Instruction to take the whole SDataPDU from the OPC UA Mapper.	
<use fsv=""></use>	Macro	SData_S is set to binary 0	
		NOTE the setting of substitute values to a different value as binary 0 is executed in the application layer or in the Machine-Specific-Interface	
<use sdata=""></use>	Macro	SData_S is set to SDataPDU	
<set requestspdu=""></set>	Macro	Instruction to transfer the whole RequestSPDU to the OPC UA Mapper	
<(Re)Start WDTO_SoOPC>	Macro	WDTO_SoOPC:= 0	
External Event			
Restart Cycle	Event	The external call of SafetyConsumer can be interpreted as event "Restart Cycle"	

\*) A macro is a shorthand representation for operations described in the according definition.

# 8.1.2.5 SafetyConsumer sequence diagram for OA

Figure 22 shows the sequence after a "a second SDataPDU error was detected before countdown timer T\_ErrRateTol stops".

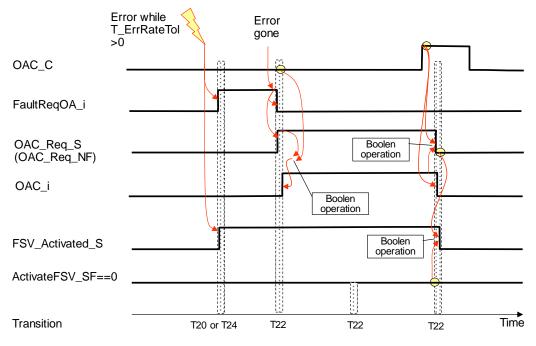

Figure 22 – Sequence diagram for OA

930 931

928 929

After the error is gone the sequence follows the logic of T22 in Table 25.

# 932 8.2 Safety communication layer protocol SafetyProsumer Classic

# 933 **8.2.1 SPDU format**

- The SPDU format will be conform to the behavior of IEC 61784-3-3 Ed3. Its integration in OPC UA will
- 935 be described in the next version of this specification.

# 936 **8.2.2 SPDU structure**

- 937 The SPDU structure will be conform to the behavior of IEC 61784-3-3 Ed3. Its integration in OPC UA
- 938 will be described in the next version of this specification.

# 940 9 Diagnosis

- The Safety over OPC UA diagnosis supports the troubleshooting of the safety communication.
- 942 Safety over OPC UA provides two features for diagnostics:
  - Safety over OPC UA diagnosis messages which are generated in case of an event which is intended to inform the operator and/or commissioning engineer to improve the settings, see Table 26. The implementation and providing of the diagnosis messages are vendor specific.
  - A method "ReadSDiagnosticDataV1" to get information for the service technician, see 9.2.

# 9.1 Diagnosis messages

	х					CommErrTO	Communication error on timeout Yes			
			х			ApplErrTO	Application error on Timeout	No		
					Х	FSV_C_OA	Operator acknowledge required, due to ActivateFSV_C at the provider			

- 950 \*) The following classification is specified:
  - 1) Transient communication error
  - 2) Permanent communication error
  - 3) Transmission quality seems not to be sufficient
    - 4) Application error
    - 5) Parameter error
  - No error

951

952

953

954

955

- Transmission errors shall not lead to diagnosis message flooding, therefore, only a single message should be shown, if multiple communication errors occur in sequence.
- 959 Optional Feature:
- 960 Extent diagnostic data by expected value and received value, e.g.
- 961 Incorrect ProviderID:
- 962 Expected ProviderID: 0x00000005
- 963 Received ProviderID: 0x00000007

# 9.2 Method ReadSDiagnosticDataV1

- This method (as part of the OPC UA Mapper) is provided for each SafetyProvider serving as a diagnostic interface. For time series observation, this interface must be polled, e.g. by the diagnostic device. For details, refer to the OPC UA information model described in 6.
- The diagnostic interface method takes no input parameters, and returns both the input- and output parameters of the last call of the method ReadSafeData.
- Additionally, a 2-Byte sequence number is added to the diagnostic interface, which will allow detecting a missed call due to polling. It counts the number of accesses to ReadSafeData.
- 972 A best practice recommendation is to store all parameters if SComErr\_diag is <> 0.

973

# 10 Safety communication layer management

# 10.1 SPDU parameter assignment

976 Export and import of SPDU parameters shall be done by exporting and importing the OPC UA information model, e.g. using XML.

# 10.2 Safety function response time part of communication

The part of Safety function response time which is used for a Safety over OPC UA communication SFRT<sub>SoOPC</sub> is specified in **Equation 1**.

# Equation 1 Calculation of safety function response time part of Safety over OPC UA

SFRT<sub>SoOPC</sub> <= WDTO\_SoOPC + WDTO\_SA

982 983

984

986

987

990

974

975

978

981

SFRT<sub>SoOPC</sub> Safety function response time part performed by Safety over OPC UA communication.

985 WDTO SoOPC

SPDU WatchDog time period at SafetyConsumer from Request (T14 or T26) to response with error free SDataPDU (T22) or in case of an SPDU-error (T18).

988 989 WDTO\_SA

maximum sample time period of the SafetyConsumer application. This is used in cyclic (high demand and low demand) safety applications.

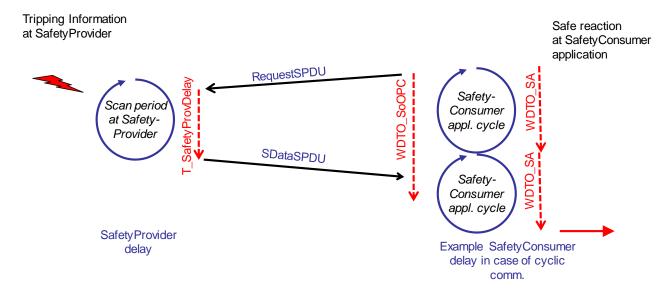

Figure 23 - principle delay times and used Watchdogs

993

994

997

998

999 1000

991 992

The additional term used in Figure 23 specified as follows:

995 T\_SDataProvDelay worst case SafetyProvider delay in error free operation. Typically, one scan time period of the SDataProvider.

Both WDTO\_SoOPC and WDTO\_SA are parameters of the SafetyConsumer. The SafetyConsumer delay depends on the maximum sample time of the SafetyConsumer application. At commissioning the integrator should be advised to design it shorter than half of the target SFRT<sub>SoOPC</sub>. If the watchdog time WDTO\_SoOPC has been chosen too short, spurious trips may occur. For avoiding this, WDTO\_SoOPC shall be chosen as shown in Equation 2.

# 1003 Equation 2 Selection of the watchdog parameter WDTO\_SoOPC

TO\_SoOPC >= T\_CD\_RequestSPDU +
T\_SDataProvDelay +
T\_CD\_SDataPDU +
WDTO\_SA

1004

1005 where 1006 T\_CD\_

T\_CD\_RequestSPDU: is communication delay for RequestSPDU
T\_CD\_SDataPDU: is communication delay for SDataPDU

- NOTE to Equation 2: the reason why WDTO\_SA is part of the summation, is because in a cyclic call of SafetyConsumer State S18, it may take one cycle after the asynchronous reception of SDataPDU to execute the checks.
- 1011 To support the calculation of WDTO\_SoOPC the SafetyProvider shall provide the T\_SDataProvDelay.
- 1012 System manufacturers shall provide their individual adapted calculation method if necessary.
- 1013 The SafetyConsumer delay depends on the maximum sample time of the SafetyConsumer application.
- 1014 At commissioning the integrator should be advised to design it shorter than half of the target SFRT soopc.
- 1015

#### 1016 11 Constraints and system requirements

#### 1017 11.1 Constraints on SPDU-Parameter

#### 1018 11.1.1 SDataBaseID and SDataProvID

- The pair of SDataProvID and SDataBaseID is used to check the authenticity of the SDataPDU by the 1019
- 1020 SafetyConsumer. It must be ensured that these pairs of IDs are either unique for all SafetyProviders,
- or that the probability that any given pair of SafetyProviders is using the same ID-pair is smaller or 1021
- equal to 10E-23. 1022
- On most systems, this can be achieved by generating a GUIDv4 or GUID, which already contains a 1023
- 1024 random number of more than 96 bits.
- 1025 The SDataProvID will be generated at engineering time.
- 1026 The SDataBaseID will be generated at engineering time or at first commissioning.
- 1027 The SDataBaseID and the SDataProvID shall be stored nonvolatile (i.e. persistent).
- 1028 11.1.2 SafetyConsID
- The SafetyConsID is a simple authenticity ID of the SData receiver. It is used to check (SafetyConsID 1029
- together with the MNR SPDU) whether the response is the answer to the request to verify the 1030
- 1031 WDTO\_SoOPC (SafetyConsID and MNR\_SPDU as expected).
- 1032 This is a random value, which can be generated at engineering time or at every start-up of the Device
- 1033 with the SafetyConsumer(s).

#### 1034 11.2 Constraints on Start value of MNR

- 1035 The MNR is used to check the timeliness of transmitted data. Over the lifetime of a device, this value
- 1036 should take a wide range of numbers. Therefore, a random number R from which the stream of MNRs
- 1037 is derived shall be generated whenever the system is restarted (i.e. in state S12 of the consumer state
- 1038 machine). This will avoid using an identical stream of MNRs each time, which would be especially
- 1039 problematic, if the device is restarted very frequently.
- 1040 There are no particular requirements on how the stream of MNRs is derived from R. For instance, the
- 1041 values R, or the MNR+1 of the last MNR sequence of this instance can be used as MNR.
- 1042 A possible way to generated R is to calculate a CRC32 over the current time.
- The requirements on the quality of the generator for R are low in this case. Any algorithm which fulfills 1043
- 1044 the following test shall be accepted:
- 1045 The device is restarted 10 times, and R is sampled.
- If all occurrences are different, the test is passed. 1046

#### 1047 11.3 Constraints on the calculation of system characteristics

#### 11.3.1 Probabilistic considerations 1048

- 1049 The data integrity checking mechanism of the Safety over OPC UA is independent from the
- 1050 mechanisms of the underlying communication system, which is called a "black channel". Thus, it can
- 1051 be used for backplane communication channels as well.
- 1052 In order to prevent a SPDU from carrying "0" only, a CRC-result of 0x00000000 is not accepted.
- In order to prevent a SPDU from carrying "1" only, the SData Qualifier "ActivateFSV\_SF" in Control-1053
- Word interprets "1" as fail-safe values. 1054
- 1055 According to IEC 61784-3 draft Ed4 and IEC 62280, the "properness" of the used CRC generator
- polynomials shall be proven. This requires calculation of the residual error probability as a function of 1056
- the bit error probability for a given polynomial, here for the 32-bit version (polynomial 0xF4ACFB13). 1057
- 1058 The residual error probability of this polynomial is calculated by the methods according [2], [3], and
- 1059

This polynomial is assessed as "proper" as there is no significant "humpback" curve with increasing bit error probability.

Figure 24 shows diagram calculated according [3] for the 32-bit CRC generator polynomial 0xF4ACFB13.

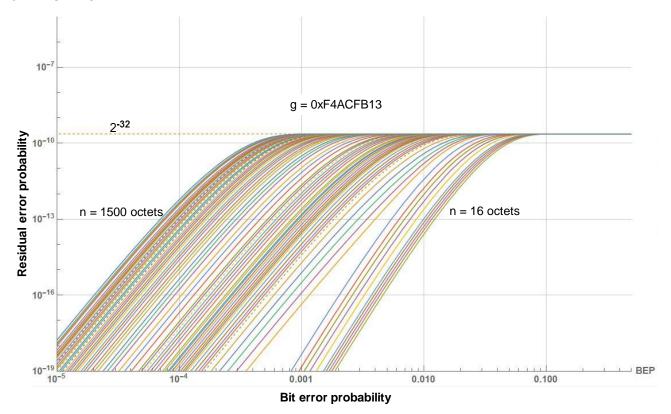

Figure 24 - Residual error probabilities for the 32-bit CRC polynomial

1066 The terms used in Figure 24 are specified below:

#### 11.3.2 Safety related assumptions

The boundary conditions and assumptions for safety assessments and calculations of residual error rates are listed here.

#### 1073 Generally:

• Number of retries in the black channel:

No restrictions

Black Channel CRC polynomials:

No restrictions

Message storing elements:

No restrictions; any number of message storing elements is permitted

• Size of SData within one SPDU:

≤ 1500 bytes

Attention of Table 28 row Operator Acknowledge

#### 1084 11.3.3 Non safety related constraints (availability)

• The atomic (consistent) delivery of entire SPDUs at the SafetyProvider and the SafetyConsumer shall be guaranteed.

10861087

1088

1085

# 11.4 Total residual error rate of Safety over OPC UA communication

The total residual error rate for the safety communication channel is the sum of the individual residual error rates for Timeliness, Authenticity, Data Integrity, and Masquerade.

Implementations according to Safety over OPC UA provide a communication, with the following PFH / respectively PFDavg values per logical connection of the safety function, are depending on the parameter T ErrRateTol, see Table 27.

The SafetyConsumer limits directly the rate of detected faulty SDataPDUs and indirectly the rate of undetected faulty SDataPDUs entering the SafetyConsumer by means of the CountdownTimer T ErrRateTol, see 8.1.2.4.

The parameter T\_ErrRateTol\_P effects the tolerated rate of errors (data integrity errors, incorrect sequence SPDUs, misdirected SPDUs), detected by Safety over OPC UA (error at CRC, MNR, SafetyConsID or SDataPDU\_ID).

1100 If the rate becomes greater than the maximum accepted rate, the operator is informed, see signal 1101 OAC\_Req\_S and safety manual, Table 28 row Operator Acknowledge.

1102

Table 27 – The total residual error rate for the safety communication channel

T_ErrRateTol_P	Allowed for SIL range	Total Residual error rate for one logical connection of the safety function (PFH)	Total Residual error probability for one logical connection of the safety function (PFDavg)
6 Minutes	Up to SIL 2	< 10 <sup>-8</sup> / h	< 10⁻⁴
60 Minutes	Up to SIL 3	< 10 <sup>-9</sup> / h	< 10⁻⁵
600 Minutes	Up to SIL 4	< 10 <sup>-10</sup> / h	< 10⁻⁶

1103

1104

1105

1106

1107

1108

1109

The requirements for the implementation of nodes are specified in the IEC 61508. The value of T\_ErrRateTol influences only the PFH/PFD of the safety communication channel.

#### 11.5 Safety manual

According to IEC 61508-2, Safety over OPC UA suppliers shall provide a safety manual. In case of Safety over OPC UA, the instructions, information and parameters of Table 28 shall be included.

Table 28 – Information to be included in the safety manual

	Item	Instruction and/or parameter	Remark
1	Safety handling	Instructions on how to configure, parameterize, commission, test, and lock this device safely in accordance with IEC 61508 and IEC 61784-3	
2	PFH, respectively PFDavg	The PFH, respectively PFDavg per logical connection of the safety function.	assumptions see 11.3.2 Total residual error rate, see 11.4
3	SFRTS0OPC	At commissioning the integrator should be advised on how to design the maximum cycle time for SafetyConsumer which shall be shorter than half of the target SFRTsoopc.	The implementation and error reaction of WDTO_SA is in the responsibility of the vendor/integrator.

	Item	Instruction and/or parameter	Remark
4	SDataBaseID / SafetyConsID	The SafetyConsID shall be unique for all SafetyProvider with the same SDataBaseID	
5	Commissioning	At commissioning of the safety function of the SafetyConsumer Application the association to this SafetyProvider requires verification and validation according to the relevant safety manuals.	
6	Operator Acknowledge	In case of "frequent indications" of OAC_Req_S==1 with "classification transmission quality seems not to be sufficient" (see Table 26) a check of the installation (for example electromagnetic interference), network traffic load, or transmission quality should be performed.  Frequent indications are defined as  - more than ones per day in SIL2 and SIL 3 applications	
		<ul> <li>more than ones per week in SIL4 applications</li> </ul>	
7	Duration of demand	In safety applications where the duration of a demand signal is short (e.g. shorter than the process safety time), and it is crucial that the consumer application never misses a demand, then a bidirectional communication must be arranged and the confirmation of receiving the demand at consumer side must be implemented in the application program, by sending appropriate information within the SData.	
8	high demand and low demand applications	The SafetyConsumer shall be called cyclic within a shorter time frame than the WDTO_SoOPC.	
9	Maintenance	Specifications for system behaviour in case of device repair and replacement.	

1111

#### 11.6 Indicators and displays

- A system with implementation of a SafetyConsumer requires the possibility of an indication of OAC\_Req\_S==1 either by an indicator (LED) or at an HMI.
- 1114 If the indication is performed by LED is is blinking with 0,5 Hz in green mode (= safety communication ok but OA\_C required).
- 1116 If the indication is performed as a message at HMI the recommended text is: Operator acknowledge requested.

# 1118 12 Assessment

#### 1119 **12.1 Safety policy**

- In order to prevent and protect the manufacturers and vendors of Safety over OPC UA product from possibly misleading understandings or wrong expectations and gross negligence actions regarding safety-related developments and applications the following shall be observed and explained in each training, seminar, workshop and consultancy.
- Any device automatically will not be applicable for safety-related applications just by using OPC
   UA and a safety communication layer.
- In order to enable a product for safety-related applications, appropriate development processes according to safety standards shall be observed (see IEC 61508, IEC 61511, IEC 60204-1, IEC 62061, and ISO 13849-2) and/or an assessment from a competent assessment body shall be achieved.

- The manufacturer of a safety product is responsible for the correct implementation of the safety communication layer technology, the correctness and completeness of the product documentation and information.
- Additional important information about actual corrigendum through concluded change requests
   shall be considered for implementation and assessment. This information can be obtained from the organizations OPC Foundation and PI.
- The implementation of the Statemachines shall be tested by the "Automated layer test for Safety over OPC UA" at a accredited test laboratory or a notified body.

# 12.2 Obligations

- As a rule, the international safety standards are accepted (ratified) globally. However, since safety technology in automation is relevant to occupational safety and the concomitant insurance risks in a country, recognition of the rules pointed out here is still a sovereign right. The national "Authorities" decide on the recognition of assessment reports.
- NOTE Examples of such "Authorities" are the IFA (Institut für Arbeitsschutz der Deutschen Gesetzlichen Unfallversicherung
  / Institute for Occupational Safety and Health of the German Social Accident Insurance) in Germany, HSE (Health and Safety
  Laboratories Inc. / Product Safety Testing and Certification Organization), or the INRS (Institut National de Recherche et de
  Sécurité) in France.

# 1150 12.3 Automated layer test for Safety over OPC UA (informative)

For details, see Safety over OPC UA test specification.

#### 12.3.1 Testing principle

An exemplary test principle for Safety over OPC UA is presented. The Safety over OPC UA test is a fully automated verification based on a mathematical model of the Safety over OPC UA finite states generated test patterns for all kinds of possible correct and incorrect SPDUs, parameters, and interactions with the upper interface of the SafetyProvider / SafetyConsumer driver. These test patterns together with the expected responses/stimulations are packed as an XML document and installed in the test tool software. The test tool performs the complete test patterns while connected to the Safety over OPC UA layer under test, compares the nominal with the actual reactions and is recording the results that can be printed out for the test report.

1161 The automated Safety over OPC UA layer tester will be approved by the Notified Body.

1162 Figure 25 shows the structure of the layer tester for SafetyProvider / SafetyConsumer.

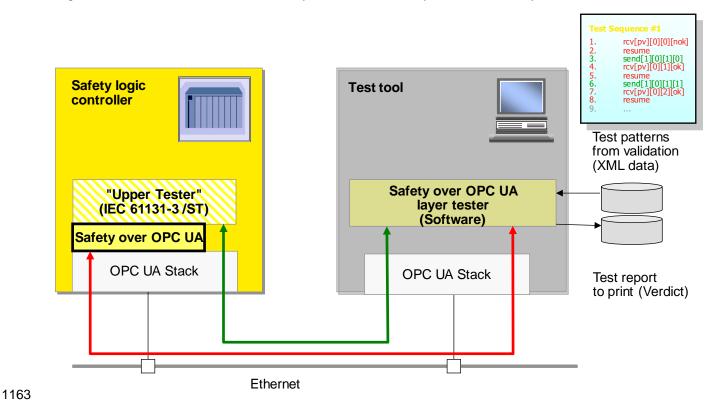

Figure 25 - Automated SafetyProvider / SafetyConsumer test

# 12.3.2 Test configuration

The SafetyProvider / SafetyConsumer tester "simulates" the behavior of an opposite SafetyProvider / SafetyConsumer Layer. Thus, it shall be configured according to the deployed OPC UA communication system. This can be done with the help of an XML file associated with the tester.

The support application (Upper Tester) within the SafetyProvider / SafetyConsumer as DUT (Device under Test) consists of a "Copy" application program (see Figure 26 and Figure 27) reading and writing the application interface between the SafetyProvider / SafetyConsumer driver instance.

The "Copy" application program can be implemented using standard program languages such as IEC 61131-3, Structured Text and run on the non safety part of PLC.

For the provider, testing is also possible to some extent, without such an upper tester.

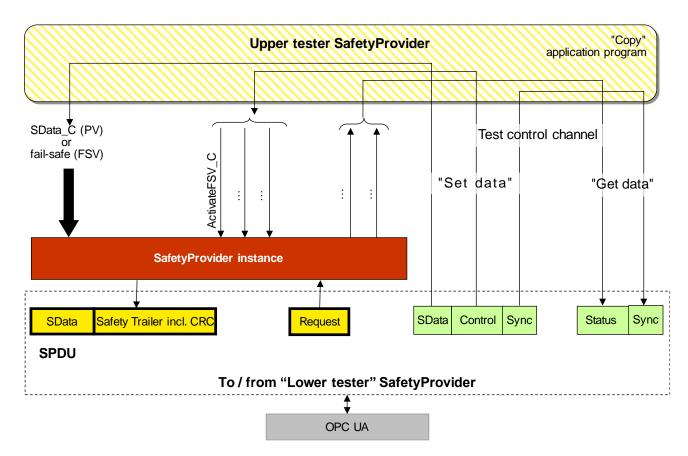

Figure 26 - Copy application program in "Upper Tester" within the SafetyProvider

The whole application program within the SafetyProvider / SafetyConsumer "Upper Tester" consists of two parts. One part, the "Set data", is responsible for the data transfer from the test control channel into the SafetyProvider / SafetyConsumer driver instance.

The second part, the "Get data", is responsible for the reverse data transfer out of the SafetyProvider / SafetyConsumer driver instance into the test control channel. In between these two activities, the SafetyProvider / SafetyConsumer driver is executing the protocol. The "Sync" data within the test control channel is looped back within the "Upper Tester".

1178

1179 1180

1181

1182

1183

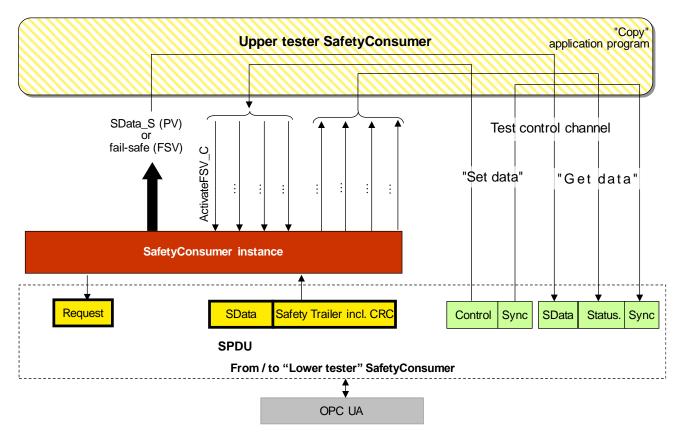

Figure 27 - Copy application program in "Upper Tester" within the SafetyConsumer

1189

1190

1191

1186

1187

- The "Lower tester" SafetyConsumer verifies the reaction on a particular test step by checking the SPDU or in case of timeout tests by checking, whether the configured timeout has been exceeded 30%.
- NOTE A tolerance of 30% is acceptable as the scope of this testing is limited to the services and behavior of the state machine and not the test of precise timing of WDTO\_SoOPC.
- For the SafetyConsumers (see Figure 27), whether testing is also possible to some extent, without such an upper tester is still under consideration.
- 1196 Suggestion to test a SafetyConsumer that is implemented in a safety device which is not programable:
- Link signal FSV\_Activated\_S to ConsNFlag "FSV\_Activated\_NF"
  - Link signal OAP\_Req\_S to OAC\_C
- 1199 NOTE This SafetyConsumer type needs no control input of SDataProvID\_C, SDataBaseID\_C, Enable\_C, and no output signal 1200 TestMode\_S and OAC\_Req\_S.
- 1201 With this rule this SafetyConsumer type can be tested.

1202

1198

The sequence chart in Figure 28 illustrates the data flow between SafetyProvider / Consumer layer tester, SafetyProvider / SafetyConsumer driver and Upper Tester.

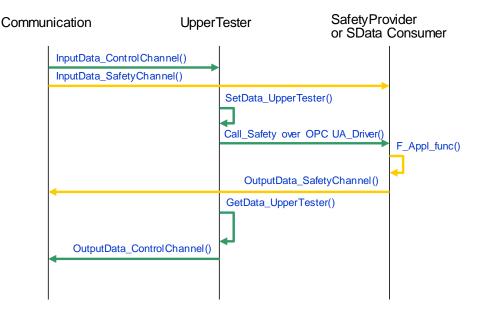

Figure 28 - Sequence chart of the "Upper Tester"

1207 1208 1209

As "Upper Tester" and SafetyProvider / SafetyConsumer respond at different times and the responses are typically not synchronized, the following trigger will be used to evaluate the response from upper tester and the response from SafetyProvider / SafetyConsumer: either as soon as both are changed to the previous responses or at the end of the Timeout according WDTO\_SoOPC\_P.

1211

# 1212 13 Profiles and Namespaces

#### 13.1 Namespace Metadata

- 1214 Table 29 defines the namespace metadata for this specification. The *Object* is used to provide version
- 1215 information for the namespace and an indication about static Nodes. Static Nodes are identical for all
- 1216 Attributes in all Servers, including the Value Attribute. See Part5 for more details.
- 1217 The information is provided as *Object* of type *NamespaceMetadataType*. This *Object* is a component
- of the Namespaces Object that is part of the Server Object. The NamespaceMetadataType ObjectType
- 1219 and its *Properties* are defined in Part5.
- 1220 The version information is also provided as part of the ModelTableEntry in the UANodeSet XML file.
- 1221 The UANodeSet XML schema is defined in Part 6.

# Table 29 - NamespaceMetadata Object for this Specification

Attribute Valu		Value	/alue

#### 13.2 Conformance Units and Profiles

1225 This chapter defines the corresponding *Profiles* and *Conformance Units* for the OPC UA Information

Model for Safety. Profiles are named groupings of Conformance Units. Facets are Profiles that will be combined with other Profiles to define the complete functionality of an OPC UA Server or Client.

# 1228 13.3 Server Facets

The following tables specify the *Facets* available for *Servers* that implement the Safety Information

1230 Model companion specification.

1231 Table 30 defines a facet for the minimum functionality necessary for providing safe data over OPC UA.

# Table 30 -Server Facet Definition

Conformance Unit	Description	Optional/ Mandatory
SafetyProvider	Supports SafetyProvider, see tbd	М

#### 1233

1234

1232

## 13.4 Client Facets

The following tables specify the *Facets* available for *Clients* that implement the Safety Information Model companion specification.

Table 31 defines a facet for the minimum functionality necessary for consuming safe data over OPC 1238 UA.

#### Table 31 -Client Facet Definition

Conformance Unit	Description	Optional/ Mandatory
SafetyConsumer	Supports SafetyConsumer see tbd	М

1245 1246

# 13.5 Handling of OPC UA Namespaces

Namespaces are used by OPC UA to create unique identifiers across different naming authorities. The *Attributes NodeId* and *BrowseName* are identifiers. A *Node* in the UA *AddressSpace* is unambiguously identified using a *NodeId*. Unlike *NodeIds*, the *BrowseName* cannot be used to unambiguously identify a *Node*. Different *Nodes* may have the same *BrowseName*. They are used to build a browse path between two *Nodes* or to define a standard *Property*.

Servers may often choose to use the same namespace for the *Nodeld* and the *BrowseName*. However, if they want to provide a standard *Property*, its *BrowseName* shall have the namespace of the standards body although the namespace of the *Nodeld* reflects something else, for example the *EngineeringUnits Property*. All *Nodelds* of *Nodes* not defined in this specification shall not use the standard namespaces.

Table 32 provides a list of mandatory and optional namespaces used in an Safety OPC UA Server.

# 12521253

Table 32 - Namespaces used in a Safety Server

NamespaceURI	Description	Use
http://opcfoundation.org/UA/	Namespace for <i>Nodelds</i> and <i>BrowseNames</i> defined in the OPC UA specification. This namespace shall have namespace index 0.	Mandatory
Local Server URI	Namespace for nodes defined in the local server. This may include types and instances used in an AutoID Device represented by the Server. This namespace shall have namespace index 1.	Mandatory
http://opcfoundation.org/UA/Safety	Namespace for <i>Nodelds</i> and <i>BrowseNames</i> defined in this specification. The namespace index is <i>Server</i> specific.	Mandatory
Vendor specific types	A Server may provide vendor-specific types like types derived from ObjectTypes defined in this specification in a vendor-specific namespace.	Optional
Vendor specific instances	A Server provides vendor-specific instances of the standard types or vendor-specific instances of vendor-specific types in a vendor-specific namespace.	Mandatory
	It is recommended to separate vendor specific types and vendor specific instances into two or more namespaces.	

1254

1255

1258

1262

# Annex A: Additional information for functional safety communication

# A.1 Hash function calculation

The function in "C" programming language for the 32 bit CRC signature calculations with the help of lookup tables is shown below:

$$r = \operatorname{crctab32} [((r >> 24) ^*q++) & 0xff] ^ (r << 8)$$
 (A.3)

1261 For this calculation Table A.33 is used.

Table A.33 - The CRC32 lookup table for 32 bit CRC signature calculations

00000000         F4ACFB13         1DF50D35         E959F626         3BEA1A6A         CF46E179         261F175F         D2B3C4C           77D434D4         8376CFC7         6A2139E1         9E8DC2F2         4C3E2EBE         B892D5AD         51CB238B         A567D898           EFA689A8         180492BB         F25D649D         06F19F8E         D44273C2         2DEE88D1         C9677EF7         3D1865E4           987C5D7C         6CD0A66F         85895049         7125AB5A         A3964716         573ABC05         BE634A23         4ACFB130           2BFC2843         DF50D350         36092576         C2A5DE65         10163229         E4BAC93A         ODE33F1C         F94FC40F           5C281C97         A884E784         41DD1142         B571EAB1         67C206FD         936EFDEE         7A370BC8         8E9BF0DB           C45441EB         30F8BAF8         D9A14CDE         2DDDB7CD         FFBE5B81         0B12A092         E24B56B4         16E7ADA7           B380753F         472C8E2C         AE75780A         5AD98319         886A6F55         7CC69446         959F6260         61339973           57F85086         A35A4B95         4ADD5DB3         BEA1A6A0         6C124AEC         98BEB1FF         71E747D9         854BBCCA	CRC32 lookup table (0 to 255)

This table contains 32 bit values in hexadecimal representation for each value (0 to 255) of the argument a in the function crctab32 [a]. The table should be used in ascending order from top left (0) to bottom right (255).

# A.2 Use cases for Operator Acknowledge

#### A.2.1 Explanation

1264

1265

1274

1275

1276

1277

1278

1279

1280

Safety over OPC UA supports Operator Acknowledge both on the SafetyProvider side, and on the SafetyConsumer side. For this purpose, both the interface of the SafetyProvider and the SafetyConsumer comprise a Boolean input called OAP\_C and OAC\_C, respectively. The safety application can read the status of these inputs on the consumer side via the Boolean outputs OAC\_Req\_S and OAP\_Req\_S, respectively.

The following sections show some examples on how to use these inputs and outputs. Dashed lines indicate that the corresponding input or output are not used in this use case. For details, see 7.3 and 7.4.

# A.2.2 Use case 1: unidirectional comm. and OA on the SafetyConsumer side

Controller A

Safety App

SafetyProvider1

SafetyConsumer1

OAC\_C
OAC\_Req\_S
OAP\_Req\_S
OAP\_Req\_S
OAP\_Req\_S

Figure 29 - OA in unidirectional safety communication

#### A.2.3 Use case 2: bidirectional comm. and dual OA

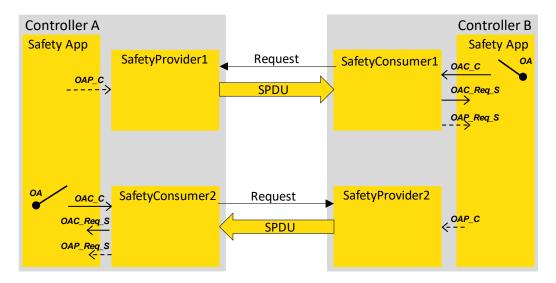

Figure 30 - Two-sided OA in bidirectional safety communication

In this scenario, operator acknowledge is done independently for both directions. Only after both sides have been acknowledged, process values are transferred and delivered in both directions.

#### A.2.4 Use case 3: bidirectional comm. and single, one-sided OA

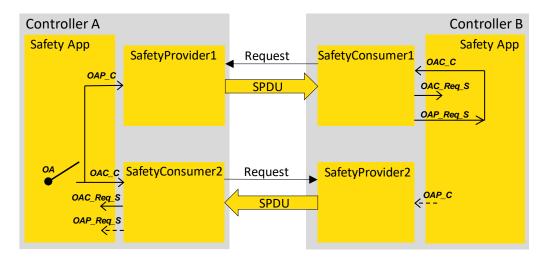

12861287

1281

1282

1283

1284

1290

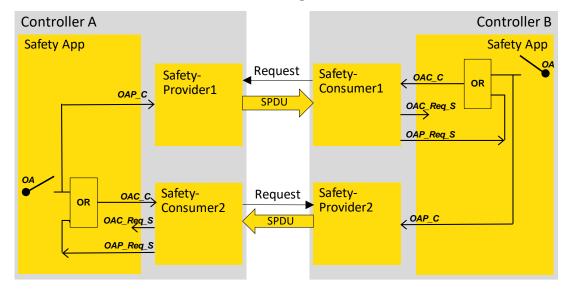

1291

Figure 31 - One sided OA in bidirectional safety communication

1296

In this scenario (see Figure 31), an operator acknowledge activated at controller A suffices for reestablishing the bidirectional connection. Both sides will cease delivering fail-safe values and continue sending process values. This is accomplished by connecting OAP\_Req\_S with OAC\_C at the SafetyConsumer of controller B. Activating operator acknowledge at controller B is not possible in this scenario.

# A.2.5 Use case 4: bidirectional comm. and single, two-sided OA

1297

1298

1299

Figure 32 - One sided OA on each side is possible

1300 1301 1302 In this scenario (see Figure 32), an operator acknowledge activated at controller A or controller B suffices for re-establishing the bidirectional connection. Both sides will cease delivering fail-safe values and continue sending process values. This is accomplished by the logic circuit shown in Figure 32.

# Annex B (normative): Safety Namespace and mappings

# **B.1** Namespace and identifiers for Safety Information Model

- 1306 This appendix defines the numeric identifiers for all of the numeric *Nodelds* defined in this specification.
- 1307 The identifiers are specified in a CSV file with the following syntax:
- 1308 <SymbolName>, <Identifier>, <NodeClass>
- 1309 Where the SymbolName is either the BrowseName of a Type Node or the BrowsePath for an Instance
- 1310 Node that appears in the specification and the Identifier is the numeric value for the Nodeld.
- 1311 The NamespaceUri for all Nodelds defined here is <a href="http://opcfoundation.org/UA/Safety">http://opcfoundation.org/UA/Safety</a>

1312

1304

1305

- 1313 The CSV released with this version of the specification can be found here:
- http://www.opcfoundation.org/UA/schemas/Safety/1.0/Nodelds.csv

1315 NOTE The latest CSV that is compatible with this version of the specification can be found here:

1316 <a href="http://www.opcfoundation.org/UA/schemas/Safety/Nodelds.csv">http://www.opcfoundation.org/UA/schemas/Safety/Nodelds.csv</a>

1317 1318

1319

1321

A computer processible version of the complete Information Model defined in this specification is also provided. It follows the XML Information Model schema syntax defined in Part 6.

1320 The Information Model Schema released with this version of the specification can be found here:

http://www.opcfoundation.org/UA/schemas/Safety/1.0/Opc.Ua.Safety.NodeSet2.xml

NOTE The latest Information Model schema that is compatible with this version of the specification can be found here:

http://www.opcfoundation.org/UA/schemas/Safety/Opc.Ua.Safety.NodeSet2.xml

1324 1325

1326

# **B.2** Profile URIs for Safety Information Model

1327 Table 34 defines the Profile URIs for the Safety Information Model companion specification.

1328

Table 34 - Profile URIs

Profile	Profile URI
SafetyProvider	http://opcfoundation.org/UA-
	Profile/External/Safety/SafetyProvider
SafetyConsumer	http://opcfoundation.org/UA-
	Profile/External/Safety/SafetyConsumer
